Minister's Message

Manitoba Agriculture, Food and Rural Initiatives (MAFRI) is pleased to participate in the development of the 2012 edition of Seed Manitoba, offering farmers the latest information on cereal, oilseeds, forages and specialty crop varieties.

This annual publication is invaluable when it comes to helping farmers make their variety decisions before spring planting. With the most up-to-date information on the performance of selected varieties,

particularly new cultivars, farmers can improve their profitability.

Manitoba's Crop Variety Evaluation Team, including MAFRI staff, has coordinated more than a hundred trials in various locations around the province. These provide post-registration performance data spanning Manitoba's diverse growing area helping farmers make variety decisions for their own unique farming operations.

Another positive aspect of Seed Manitoba is that the publication reflects a cooperative effort involving Manitoba's agri-business community, farmers, commodity groups and various levels of government to ensure that the information farmers receive is impartial and current.

As Minister, my department is committed to helping farmers increase their profitability and supporting Seed Manitoba is one example of how we are delivering on this commitment. Congratulations to everyone who has participated in this year's publication.

Stan Struthers
Minister of Agriculture, Food and Rural Initiatives

President's Message

Last year I began this letter with, "The 2010 growing season certainly provided an opportunity to highlight the differences between crop varieties." For 2011, a different set of growing conditions, however the same line applies. Extreme conditions this spring for much of the province kept producers guessing and seeding plans were changed daily. Following that, much of the province saw a significantly drier summer to test varieties in a way many had never seen.

Diverse farming practices, changing soil types, and varying rainfall and heat accumulations from region to region often result in different varieties making up the bulk of acres for a given location. To accommodate these regional differences Seed Manitoba and the MCVET variety testing system is set up to allow producers to make variety comparisons both on a regional basis by comparing data from local sites and on a broader basis when averaged over all sites in the province.

Manitoba producers are privileged to also have access to this seed guide in an online version (www.seedmb.ca). The website continues to be updated throughout the winter with data not available in time to meet the seed guide publication deadlines. Whichever format you prefer, both provide not only yield comparisons but also evaluations of several other key agronomic factors such as lodging, maturity, and disease resistance. As a one stop resource to access independent testing of these critical characteristics, this guide provides the best data for producers to make informed variety selections.

The Manitoba Seed Growers' Association is proud to be a part of the MCVET team and wishes to thank the extensive network that comes together to make this publication happen. MCVET receives excellent support from MAFRI staff, provincial grower associations, site co-operators, site contractors and our many industry contributors and sponsors.

Craig Riddell
President, MSGA

Thank you to MCVET Sponsors and Supporters

MCVET gratefully recognizes the support and financial contribution of the following organizations:

Agri-Food Research and Development Initiative (ARDI)
Manitoba Agriculture, Food and Rural Initiatives
Manitoba Pulse Growers Association

Manitoba Seed Growers' Association
Manitoba Co-operator SeCan
Winter Cereals Manitoba Inc.

MCVET greatly appreciates the efforts of our site contractors:

Ag-Quest Inc.
Agriculture and Agri-Food Canada
Canada-Manitoba Crop Diversification Centres
ICMS
James Richardson International
Kelburn Farms
Murphy et al. Inc
S.S. Johnson Seeds Ltd.

Parkland Crop Diversification Foundation
Prairies East Sustainable Agriculture Initiative
University of Manitoba
Viterra
Westman Agricultural Diversification Organization

MCVET would also like to express its gratitude to:

Locally organized variety trials at Stonewall (SICTC), Portage la Prairie (CROP) and Beausejour (ASCIA).

Provincial grower organizations who provided monetary support and donated data to Seed Manitoba 2012.

Companies and individuals who performed seed quality analysis.

Syngenta for providing seed treatment.

Welcome to *Seed Manitoba 2012*

by Pamela de Rocquigny, Seed Manitoba editor, Manitoba Agriculture, Food and Rural Initiatives

Welcome to *Seed Manitoba 2012*, the Variety Selection and Growers Source Guide, compliments of Manitoba Agriculture, Food & Rural Initiatives, the Manitoba Seed Grower's Association and the Manitoba Cooperator. *Seed Manitoba* continues to be a premiere source for unbiased, local variety information from sites across Manitoba.

Rain, Rain go away... but it didn't come back another day!

The 2011 growing season was yet again another challenging one for Manitoba farmers. The season started much like it left off in the fall of 2011...wet. Precipitation continued into May and June, resulting in excessive moisture, delaying and/or preventing seeding, as well as impacting plant stands and crop development. Then summer months came, but the rain didn't and precipitation became minimal across most of the province for the remainder of the growing season. There were good things that came of this limited precipitation – it allowed crops to develop rapidly, permitted drying of land so producers could rehabilitate unseeded fields in preparation winter cereal planting in 2011 or for the 2012 season. It also allowed haying and crop harvest operations to occur under excellent conditions. However, the limited precipitation did have an impact on yield and quality in some crop types.

Much like what Manitoba farmers saw in their own fields, many of the variety trials across the province showed variability in yields and quality, resulting from the excessive early moisture followed by drought-like conditions. Due to the hard work of our site contractors, most sites were harvested and data approved by MCVET or the respective commodity organization for publication in *Seed Manitoba*. For the yield and quality data that did not meet our deadlines, it will be available

in the Web Exclusive section of our website www.seedmb.ca. This year it will feature information for soybeans, edible beans and sunflowers. This information will be released in weekly intervals starting January 2012.

Changes to note

There are a few changes in *Seed Manitoba 2012*, some that can be seen while some are behind the scenes. In the Oilseed Crops section, we see the re-emergence of independent variety evaluations for canola called Canola Performance Trial (CPT) testing. A new format was designed to be more reflective of field practices, which included implementation of corresponding herbicide systems applied to matching herbicide tolerant varieties and no variety has been deemed as the "check". A field scale component was also added to compare variety performance and will provide depth to assessing consistency from small plot to field sized performance. All data is vetted by qualified personnel to ensure that accurate data is being presented to farmers. Accompanying the table is a further explanation of where this information is coming from and how to use it so take the time to read it before diving right into the results.

In *Seed Manitoba 2012*, you will notice some crop types were not tested this year as there were no new supported varieties from the registration meetings for evaluation (durum wheat, flax). Or the number of varieties tested were decreased to more accurately reflect the acreage those crops are grown on in the province (lentils, field peas). This assists MCVET in maintaining balanced testing budgets while still providing information on the newest varieties.

Behind the scenes we welcomed Dennis Lange, Provincial Pulse Specialist, to the *Seed*

Manitoba team. He brings extensive experience to his new role with MAFRI and is one of the four Commodity Editors involved with the production of *Seed Manitoba*. As in past years, any questions related to the data found in *Seed Manitoba 2012* can be directed to the Commodity Editors: Pam de Rocquigny for cereal crops and grain corn, Anastasia Kubinec for canola, flax, mustard and sunflower, Dennis Lange for lentils, peas, faba-beans, field beans and soybeans, and Glenn Friesen for annual and perennial forages.

Use single site year data with caution

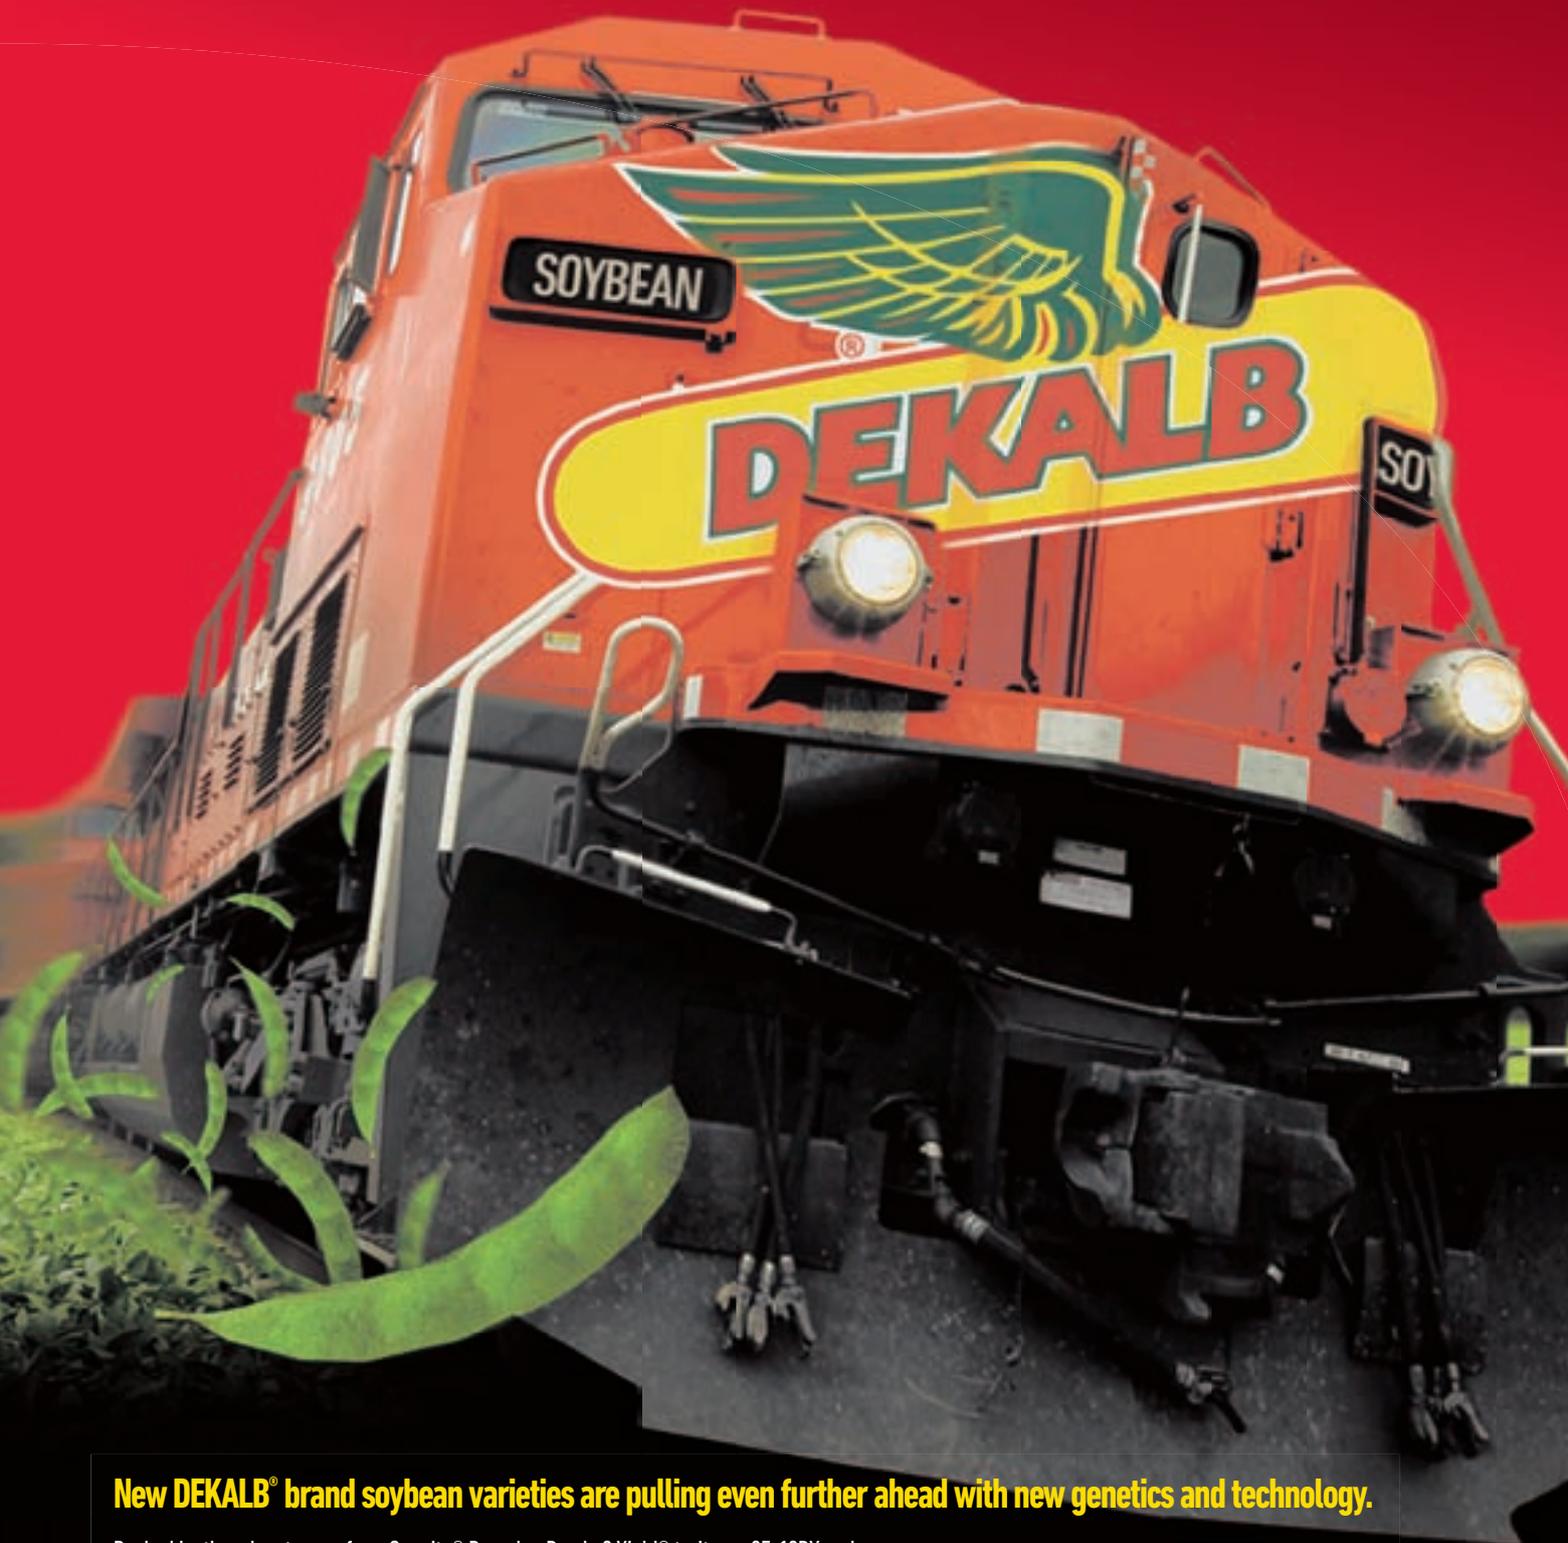

A friendly reminder as you read through *Seed Manitoba 2012* to always use caution when looking at single site year data. Varieties that perform well under one set of environmental conditions may not perform as expected under the next year's conditions. A good example is to look at the effect of this summer's weather on maturity data for soybeans. The hot, dry weather resulted in beans maturing quicker than if we'd seen a year with less heat and more moisture in the season. Therefore you don't want to put too much emphasis on how early they matured this year and coming to the conclusion you can get by with a longer season variety with higher yield potential. One year's data isn't enough to accurately predict a variety's maturity and with continued testing a better feel for the true maturity ratings will be gained. Remember, the more site years of data (especially if it is over more than one season), the more dependable the data.

A collaborative effort

Seed Manitoba 2012 is a result of industry, government and producers working together to provide comprehensive variety performance data. Thank you to our MCVET Sponsors and Supporters, the site contractors, commodity organizations, and locally supported grower groups, as listed on page 5. Thank you to Craig Linde, Interim MCVET Coordinator, who supplied 2011 yield data from MCVET. It is our collective hope you find the information in *Seed Manitoba 2012* of great benefit as you make variety decisions in the coming months.

Detailed quality data for various crop types will be available in the Web Exclusive section at www.seedmb.ca

RUNAWAY YIELD MOMENTUM

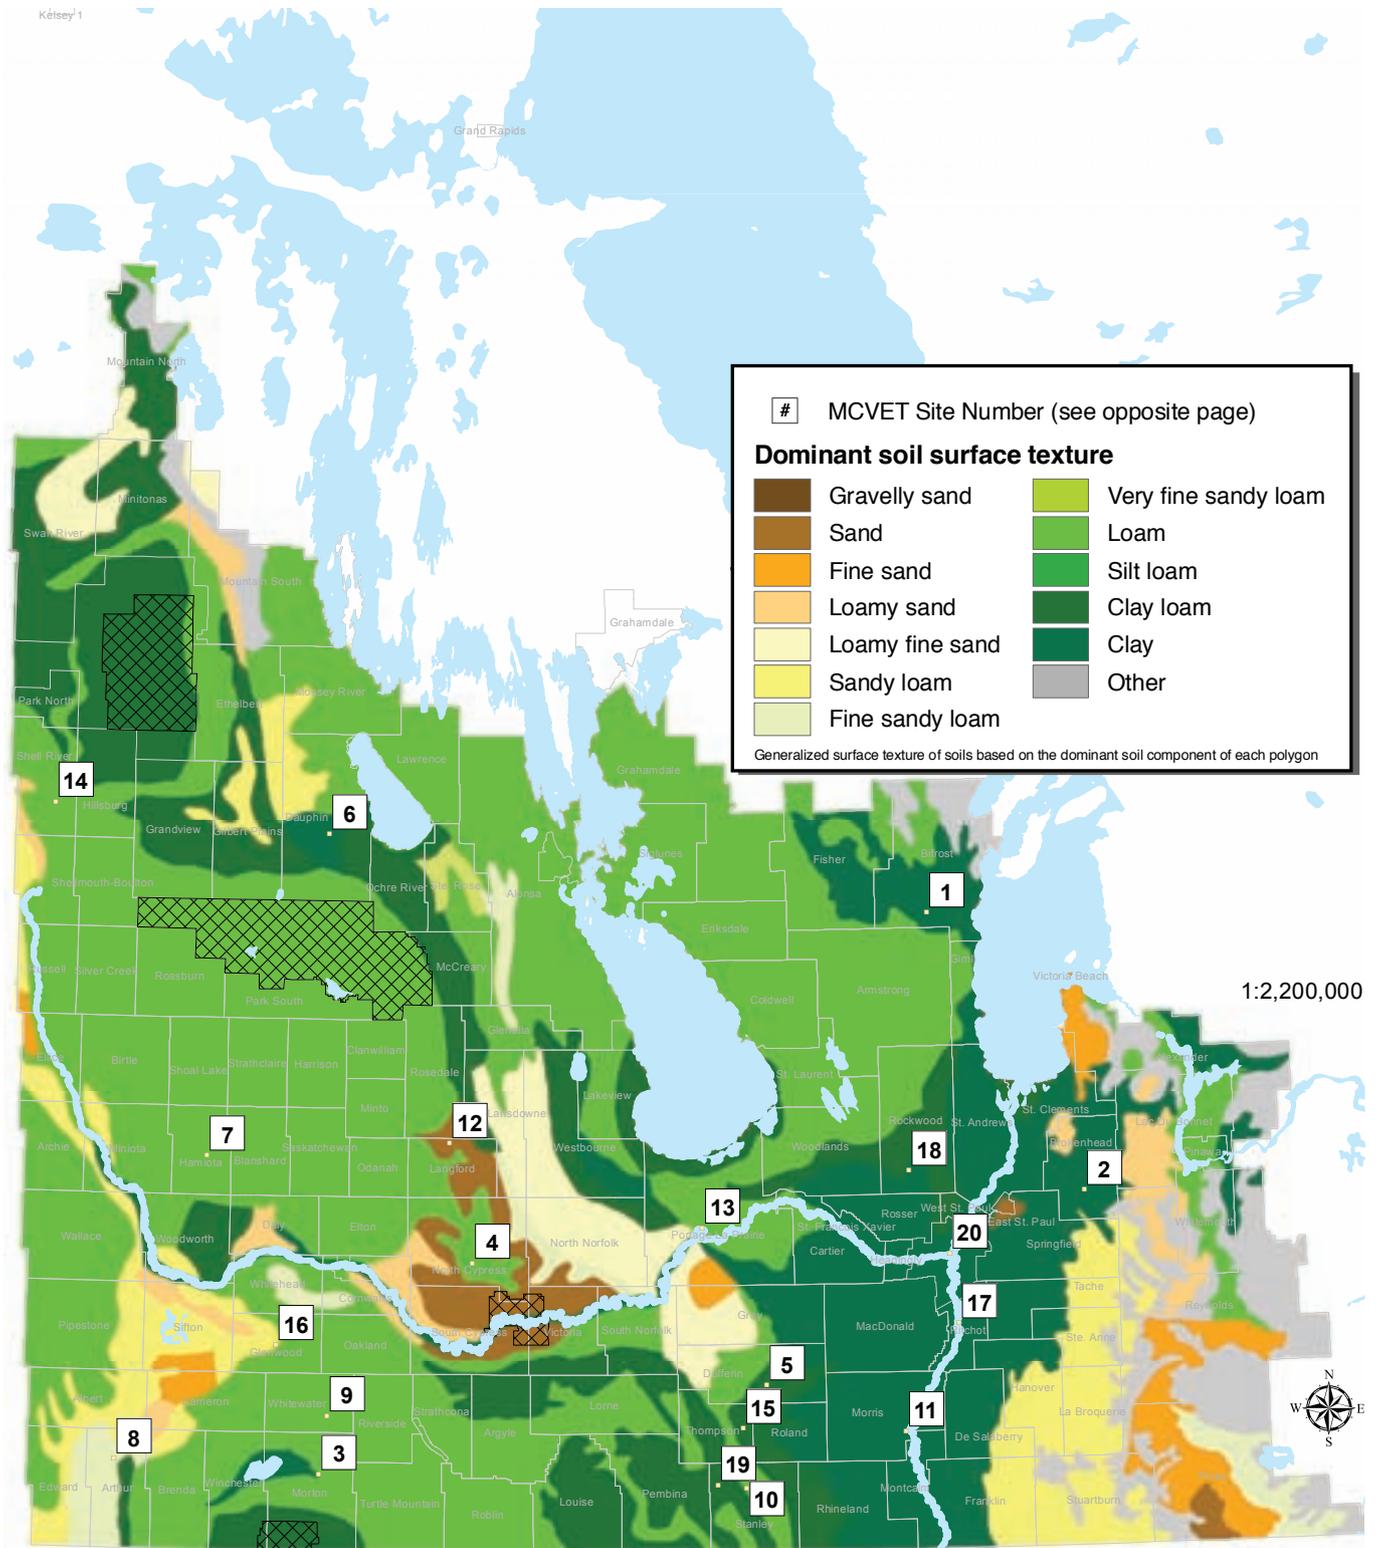

New DEKALB® brand soybean varieties are pulling even further ahead with new genetics and technology.

Backed by the advantages of our Genuity® Roundup Ready 2 Yield® trait, our 25-10RY and our new varieties 24-10RY and 23-10RY, offer great options for early maturity with our strongest yield potential yet. Supply is limited, so book your DEKALB brand soybeans before you miss the train. Visit DEKALB.ca for trial results this Fall.

Monsanto Company is a member of Excellence Through Stewardship® (ETS). Monsanto products are commercialized in accordance with ETS Product Launch Stewardship Guidance, and in compliance with Monsanto's Policy for Commercialization of Biotechnology-Derived Plant Products in Commodity Crops. This product has been approved for import into key export markets with functioning regulatory systems. Any crop or material produced from this product can only be exported to, or used, processed or sold in countries where all necessary regulatory approvals have been granted. It is a violation of national and international law to move material containing biotech traits across boundaries into nations where import is not permitted. Growers should talk to their grain handler or product purchaser to confirm their buying position for this product. Excellence Through Stewardship® is a service mark of Excellence Through Stewardship. ALWAYS READ AND FOLLOW PESTICIDE LABEL DIRECTIONS. Individual results may vary, and performance may vary from location to location and from year to year. This result may not be an indicator of results you may obtain as local growing, soil and weather conditions may vary. Growers should evaluate data from multiple locations and years whenever possible. Roundup Ready® crops contain genes that confer tolerance to glyphosate, the active ingredient in Roundup® agricultural herbicides. Roundup® agricultural herbicides will kill crops that are not tolerant to glyphosate. ¹ Weather data is reported from May 1st to September 15th and reflects the percentage of the normal accumulations as calculated using the long-term average for the past 30 years.

Other site characteristics

Seeding dates for individual trials can be found at www.seedmb.ca. To access the information, click on the link to "2011 Manitoba Variety Trial Locator" followed by the corresponding location, then select the appropriate crop type to link to the plot plan. Due to the number of crops per site, there may be several different seeding dates for any one location. The information for the 2011 growing season will remain on the website until June 2012, at which time the information will be removed and the current crop year will be posted by mid-July.

As per the MCVET protocol, all sites are fertilized at levels to achieve maximum crop performance. Weed control is applied as required to achieve a relatively weed free area. Insecticides are applied as required, while fungicides are not applied to any trials.

Please contact Craig Linde at (204) 841-4712 or e-mail craig.linde@gov.mb.ca for questions pertaining to any MCVET site.

Roundup Ready 2 soybeans on tap for 2012

Some are worried there won't be enough early maturing seed to meet Manitoba farmers' needs

by Allan Dawson, Co-operator staff

Supplies of early maturing varieties of Roundup Ready2 (RR2) soybean seed could be tight next spring.

"I would say the growers that need the earlier varieties — anyone north of No. 1 highway — should be looking at booking them pretty quick," said Legend Seeds seed manager Mark Jorgenson.

Most, but not all, Manitoba soybean seed suppliers will sell only RR2 soybeans in 2012. The shift away from RR1 varieties coincides with the expiration of the RR1 patent in August this year.

There were concerns there might not be many early maturing RR2 varieties to choose from in 2012. But about half of the 43 RR2 varieties tested this year in the Manitoba Crop Variety Trials (MCVET), are earlier maturing than the mid-season check variety Portage, and the other half are later maturing, said Dennis Lange, Manitoba Agriculture, Food and Rural Initiative's pulse crop specialist. However, this year's maturity data could be a bit skewed because of dry, hot growing conditions later in the growing season.

"This year, some of the varieties matured earlier than they might have if we'd got more rain during the summer," Lange said. "They did make it this year, but there were some varieties that didn't make it either."

DeKalb is offering a couple of early maturing RR2 varieties that should alleviate farmers' concerns, said Monsanto spokeswoman Trish Jordan. However, she added DeKalb is almost sold out.

"So farmers should check with their seed supplier and book soon," Jordan said.

Dry harvest conditions also make soybeans more vulnerable to injury, which can reduce germination, Jorgenson said in a late October interview when germination results were not available.

Demand naturally affects supply as well. Ray Wytinck, general manager of NorthStar Genetics, expects Manitoba farmers will seed more soybeans in 2012 if they can.

"Our supplies are relatively good," he said. "The question is, how many acres of soybeans are going to get planted next year? If the market grows substantially there could potentially be a shortage of seed."

This year, the Manitoba Agricultural Services Corporation says 587,383 acres of soybeans were planted, up from 516,392 in 2012. And that's despite an extremely wet spring. Had the weather been better, farmers might have seeded 700,000 acres of soybeans, Wytinck said.

"The feedback we're hearing is guys are going to put more acres in on the bean side," he said.

After struggling with too much moisture during seeding, the tap turned off and many crops suffered from a lack of rain later in the summer. But soybeans generally fared better than canola under the less-than-ideal conditions, according to Wytinck. That, and the fact that soybeans are cheaper to grow, is driving increased acreage.

Most of the RR2 varieties will be grown on a large commercial scale for the first time in 2012. Wytinck is advising caution.

"If you're growing more than 300 acres of beans, you definitely should be growing more than one variety and varying the maturity," he said. "The longer maturity variety gives you more yield potential, but if they freeze out it doesn't matter what the yield potential is."

"I would say the growers that need the earlier varieties — anyone north of No. 1 highway — should be looking at booking them pretty quick"

— MARK JORGENSON

Farmers in traditionally cooler areas should focus on earlier maturing varieties, but can include some mid-season ones, too. Farmers in the warmer areas can plant mid-season varieties, but also some later ones.

"Maturity is always king," Lange said. "You can have something that yields high but if you put it in the wrong area, it won't yield high because it may be too long for that particular area. You want to look for a variety that is early and a variety that has a respectable yield."

There are other factors to consider, including disease resistance and iron chlorosis tolerance.

Lange also warns that one year of data isn't usually enough to provide a complete picture of a variety.

"Farmers should look at different sources of data, including *Seed Manitoba* as well as private industry stuff and use that data to help them make their decision," he said.

Jorgenson, Wytinck and Jordan agree RR2 has a yield advantage.

“We saw a pretty nice increase with the RR2s, especially on the mid to late varieties” Jorgenson said. “We’re seeing really big increases in some cases. On the earlier ones, we’re seeing increases but not as dramatic, but increases that warrant increases in prices. And the prices haven’t gone up that much per unit.”

NorthStar Genetics’ earlier maturing RR2 varieties yielded five to six per cent better than RR1 varieties, Wytinck said. The mid to late season varieties saw a 15 per cent increase at seven test sites, with one variety up 26 per cent, he said.

“The early season RR2 is yielding better than a mid-season RR1,” he said.

It looks like there will be a yield advantage to RR2, Lange said. Some of the varieties in this year’s trial were earlier than Portage, but yielded more.

Monsanto’s patent on the herbicide tolerance trait in RR1 soybeans has expired. That means farmers can keep the production from their 2012 soybean crop for seed so long as they don’t sign an agreement with a seed company saying they won’t save seed. Farmers cannot legally save any of the 2011 RR1 crop for future seed use.

There will be some RR1 soybean varieties for sale in 2012, but most companies selling RR1 varieties will require buyers to agree not to save seed.

That’s the case with Pioneer Hi-Bred. Its traditional “one-use” agreement will still apply to the RR1 soybeans it sells in 2012, said company president Ian Grant.

In addition, 50 of Pioneer’s new RR1 soybean varieties will be protected by “Variety Improvement Patents,” which makes it illegal for farmers to save the seed.

Pioneer wants to send a clear message that despite the expiration of Monsanto’s RR1 patent in 2011, farmers will not be allowed to save Pioneer’s RR1 soybean seed in 2012 or beyond.

“We believe that Canadian soybean growers can benefit from access to the latest and most advanced seed,” Grant said. “By protecting soybean varieties with Variety Improvement Patents, we’ll be better equipped to bring growers the innovation, yield gains, and increased profitability they expect.”

Grant said Pioneer’s RR1 soybeans are as good or better than competitor’s Roundup Ready 2 varieties.

“Our soybeans are on more acres than any other brand in Canada,” he said. “It’s about the good genetics and how we work with growers to maximize the performance. Secondly, we believe that farmers should have choice. They shouldn’t all be forced to go all Roundup Ready 2 or all Roundup Ready 1.”

Supplies of early maturing Roundup Ready 2 soybean seed could be tight in the spring.

Seed Interactive...

A Manitoba Crop Variety Decision Tool

by Pamela de Rocquigny, Provincial Cereal Specialist, MAFRI

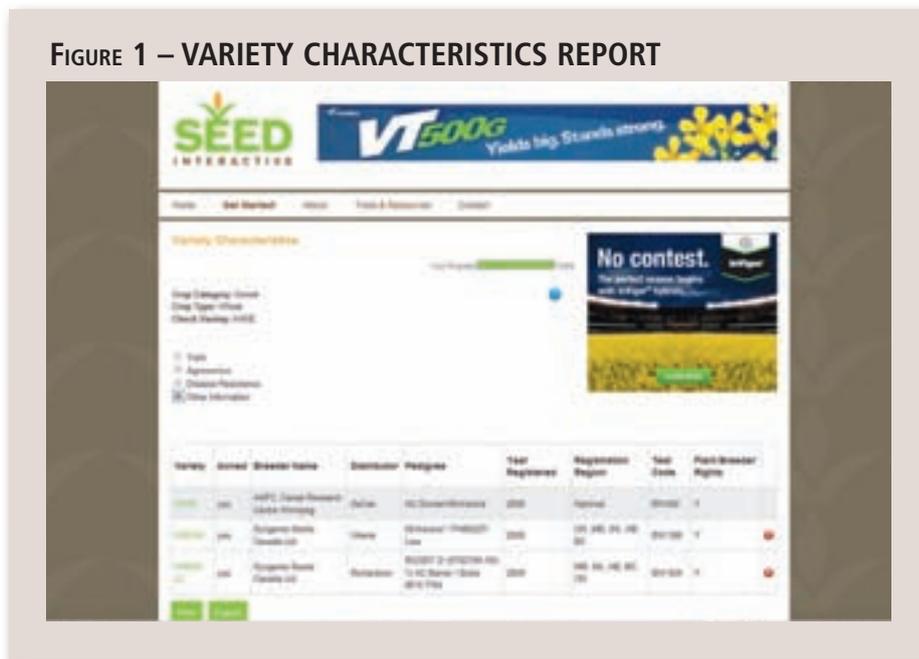

A suite of tools are available to assist Manitoba producers with variety selection. The most well-known, *Seed Manitoba*, continues to be a premiere source for unbiased, local variety information for Manitoba producers. Next came www.seedmb.ca, which hosts current and archived digital editions of *Seed Manitoba*. The website also has information of where the various Manitoba Crop Variety Evaluation Team (MCVET) trials are located and the detailed plot plans so producers can visit the sites and take their own notes on how varieties are performing during the season. The latest addition, SEED INTERACTIVE, A Manitoba Crop Variety Decision Tool (www.seedinteractive.ca), was launched in Spring of 2011.

The Goal of SEED INTERACTIVE

SEED INTERACTIVE was created to improve Manitoba's grain producers' competitive ability by providing them an online decision tool to help make variety choices for their farms. The biggest advantage of SEED INTERACTIVE is it allows producers to tailor output taking into consideration their own agronomic and management requirements. Crop types currently available on SEED INTERACTIVE include spring wheat (including durum), winter wheat, barley, oats, flax and peas. Spring 2012 will see sunflower (oil and confectionary) and soybean data added. And future editions will feature field beans, lentils, and fall rye.

Two reports available

With SEED INTERACTIVE, you can generate two types of reports – a Variety Characteristics Report or a Yield Comparison Report. With both, one of the biggest advantages is the ability of producers to choose their own 'check' variety to make comparisons. In *Seed Manitoba*, both the long term data and the annual yield comparisons at various locations are compared to a 'check'. For example, in spring wheat all varieties are expressed as a percent of the selected 'check' variety AC Barrie. However, what happens if you want to compare a variety that you commonly grow on your own farm to the newest varieties? This is where SEED INTERACTIVE can

help as it allows you to choose your own check and make the comparisons you want to make.

Variety Characteristics Report

The Variety Characteristics report is used to generate an overall performance summary using all data available for a select number of varieties that you are interested in. The Variety Characteristics report can be compared to the Variety Description Table currently found in *Seed Manitoba* and contains information on overall yield performance using all available data, disease resistance and general agronomic performance. However, it also contains other information not found in the guide. With this type of report, multiple varieties can be selected for comparison. However, caution must be exercised when comparing the generated relative yield performance between the multiple varieties. This is because the number of locations and years used to compare each variety with the check may differ.

Let's walk through an example for spring wheat.

In the Crop Type Category box, select 'wheat' and in the Report Type box select 'Variety Characteristics'. Next you'll want to choose your check variety. The varieties are divided into two categories – Most Commonly Grown, which represent varieties most commonly grown (by acres) in Manitoba over the past three years, or Current and New which either shows varieties that are relatively new and growing in demand, have just been registered, or at one point were popular in Manitoba but over recent years have fallen in popularity. Selecting a check from the Most Commonly Grown category will give you the largest dataset which increases the reliability of the generated report. For this example, let's select 'KANE'. You'll then want to choose the varieties you want to compare...here only the varieties that have been tested in the same trial as KANE will appear. Let's select the newer varieties of 'WR859 CL' and '5603HR'. Now all you need to do is hit 'Run Report'.

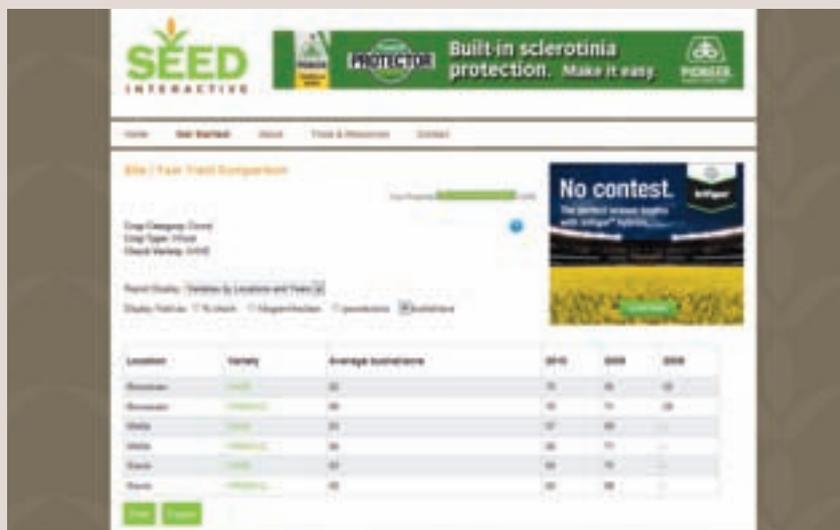

The generated data can be presented in several ways. The first report looks at the yield data, which

shows the number of site years tested, the yield expressed as a percent of your selected check KANE, and protein expressed as plus/minus of KANE. In our report, both 5603HR and WR859 CL have 26 site years of data available where 5603HR yielded 104% of KANE and WR859 CL yielded 101% of KANE...so pretty similar. However, you can also view the agronomic information by clicking on the 'Agronomics' radio button which gives you information for lodging, maturity and height. Click on 'Disease Resistance' and resistance level ratings for various diseases are presented. And finally you can click on 'Other Information' which will provide you information not found in Seed Manitoba, including the breeder, the pedigree, the year registered, the registration region and test code it was evaluated as in the Co-operative Registration Trials (see Figure 1 - Variety Characteristics Report). Anywhere along the way, you can either 'Print' a copy or 'Export' your report into an excel spreadsheet. One more additional feature is the ability to click on the variety names KANE, 5603HR or WR859 CL and it will direct you to the seed growers for those varieties in Manitoba.

Yield Comparison Report

The Yield Comparison Report on SEED INTERACTIVE can be compared to the Yield Comparison Tables found in Seed Manitoba. Let's walk through another example for spring wheat. The first steps remain the same but at the Report Type box select 'Yield Comparisons' instead. The next step is another big advantage of SEED INTERACTIVE where producers can select one or multiple locations to customize the data. This allows a producer to single out a site which may be close to their farm or select a group of locations that represent the growing conditions and soil types in their region. Or they can select all locations as to provide the best estimate of the average performance. Always view the data with caution if selecting only one location. In our example, let's select Boissevain, Melita and Souris, then click Continue. Next you'll want to choose your check variety. Just like the Variety Description report, the varieties are divided into two categories – Most Commonly Grown and Current and New. Once again, selecting a check from the Most Commonly Grown category will give you the largest dataset which increases the reliability of the generated report. Let's select 'KANE' again. You'll then want to choose one variety you want to compare to KANE. With this report, users are restricted to compare only one variety in order to maximize the number of locations and years in common with the selected check. This provides the most complete and reliable information for comparison. In the future, an additional

FIGURE 2 – YIELD COMPARISON REPORT

Yield Report that uses calculated rolling averages for varieties will be available. This will allow for multiple varieties to be compared to the selected check variety. Let's select the variety 'WR859 CL' and hit 'Run Report'.

Again the generated data can be presented in several ways by using the drop down menu beside Report Display. The default, 'Varieties by Year' data, presents the Yield Averaged over all the years available (in our example, from 2008 to 2010), the

SEED INTERACTIVE –
A Manitoba Crop Variety
Decision Tool at
www.seedinteractive.ca was
launched in Spring of 2011

number of site years of data, and the Yield by Year data (which is averaged over our three selected locations). In our report, there is 7 site years of data available where averaged over all years WR859 CL yielded 102% of KANE. And if we look at each individual year, we see WR859 CL yielded 101% of KANE in both 2010 and 2009 and 111% in 2008. If we select 'Varieties by Locations' from the drop down menu, data is presented for the Yield averaged over the three locations and each individual location where both the selected check and the variety were tested in the same experiment. In our report, WR859 CL yielded 107% of KANE at Boissevain, 102% at Melita, and 96% at Souris.

Remember, some of the locations chosen in the selection process may not appear if KANE and WR859 CL were not tested together at that location. Now if you then select 'Varieties by Locations and Years' from the drop down menu, you'll be presented with the average percent of check yield and each individual site year and location where those two varieties were compared against each other (see Figure 2 - Yield Comparison Report). As you'll note in this report, no data is available for 2008 at the Souris or Melita locations, indicating KANE and WR859 CL were not tested together in 2008 at either Souris or Melita. With any one of these three displayed reports, you can click on the desired radio button beside 'Display Yield' as to view yield as % of check, in kilograms per hectare, pounds per acre, or bushels per acre. And like the Variety Comparison Report, anywhere along the way, you can either 'Print' or 'Export' your report into an excel spreadsheet or click on KANE or WR859 CL and it will direct you to the seed growers for those varieties in Manitoba.

SEED INTERACTIVE, available at www.seedinteractive.ca, is an on-line tool that allows Manitoba farmers to customize the output to meet their specific needs. Use SEED INTERACTIVE, along with Seed Manitoba and www.seedmb.ca, to increase productivity and profitability through improved variety selection. Data from 2011 for spring wheat, winter wheat, barley, oats and peas will be available on SEED INTERACTIVE mid-December. SEED INTERACTIVE is a collaborative effort between Manitoba Agriculture, Food & Rural Initiatives, Farm Business Communications, and the Manitoba Seed Growers Association.

OTHER CANOLA IS YELLOW... OURS IS GOLD

6060 RR
6040 RR

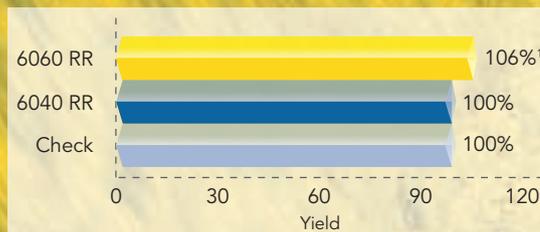

6060 RR SETS THE NEW GOLD STANDARD

BrettYoung's highest yielding hybrid, 6060 RR, out-yielded commercial checks by 2.6 bu/ac (106%). Providing impressive yields, 6060 RR is a leader in its class.

For proven consistent performance with yields equal to the commercial checks and better standability and harvestability, turn to 6040 RR.

In the end, it all comes down to performance, and BrettYoung brings a new standard of excellence to the field.

brettyoung.ca 800-665-5015

¹Check is an average of 45H28 and 7265 over 18 replicated field scale grower trials (2010).

"In any field, a gold medal performance is a result of preparation, hard work and unwavering support."

JON MONTGOMERY
2010 Olympic Gold Medalist – Skeleton
2008 World Championship Silver Medalist

Variety Description Key

A grey "CHECK CHARACTERISTICS" box has been placed at the bottom of each table to display the long term yield, # of site years, % protein and any other check attributes.

Except for the long term average yield and protein data, variety description information was obtained from the Co-operative Registration Trials.

Protein data is from MCVET plots harvested from 2002 to 2011. Actual protein will depend on seasonal growing conditions and fertility levels.

"Resistance Level" Disease ratings: R = Resistant; MR = Moderately Resistant; I = Intermediate; MS = Moderately Susceptible; S = Susceptible; " - " = not available

"Resistance Level" Lodging ratings: VG = Very Good; G = Good; F = Fair, P = Poor; VP = Very Poor; " — " = not available.

Site Years Tested is the cumulative number of locations over the years that a variety has been tested against the check. The more site years the more dependable the data.

☉ Indicates a variety that is protected by Plant Breeder's Rights or a variety where protection has been applied for but not yet granted at time of printing.

Key to 2011 Yield and Protein Tables

Yields derived over 2 or more growing seasons are the best indicator of variety performance. For new varieties, "2011 Average Yield" over all sites is more reliable than data from a single location. Use single site year data with caution.

Data collected from Portage is not presented as an individual site but data is included in the 2011 Average Yield and Protein columns in the Yield and Protein Comparisons tables and the long term yield and protein columns in the Variety Description table.

CV% = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD% = Least Significant Difference. Varieties must differ by the LSD% to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

Cereal Crops

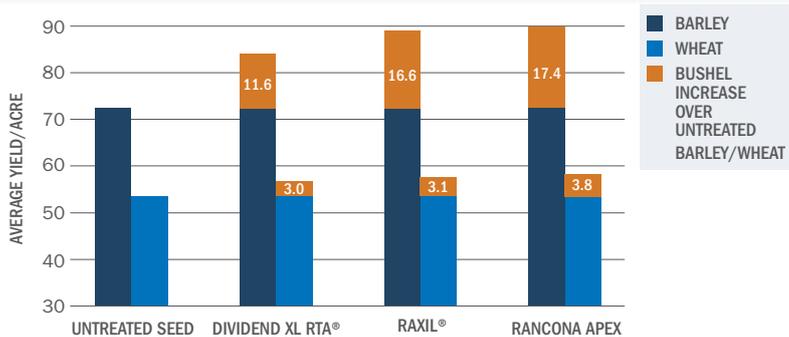

RANCONA APEX

WHERE POTENTIAL MEETS ACTUAL YIELD

Yield begins beneath the soil surface, which means seed and soil-borne disease can strike before your crop even emerges from the ground. Help your crop achieve the highest yield possible by using Rancona® Apex, the broadest-spectrum seed-applied fungicide available. Offering a higher level of disease control on wheat, durum, barley, oats, rye and triticale. Rancona Apex provides faster emergence, increased stands and healthier, more vigorous plants—all of which adds up to higher yields¹ and greater profits.

Rancona Apex. Isn't it time your yield lived up to its greatest potential?

YIELD BUSHELS/ACRE ON BARLEY² AND WHEAT³

¹ Independent research and university trials 2005-09.

² Tests conducted in Alberta (N=4), Montana (N=1), Manitoba (N=2) and North Dakota (N=2). Average of 9 trials. Raxil T was formulation of Raxil used in trials.

³ Tests conducted in Alberta (N=5), Montana (N=5), Manitoba (N=2) and North Dakota (N=3). Average of 15 trials. Raxil MD was formulation of Raxil used in trials.

Comments:

The Canadian Food Inspection Agency has provided notification in their Proposed List of Variety Registration Cancellations the two-row spring barley variety **Rivers** will be cancelled (deregistered) effective August 1, 2013.

It is strongly recommended for producers to use a combination of the Canadian Food Inspection Agency's List of Registered Varieties (www.inspection.gc.ca) and the Canadian Grains Commission's Variety Designation Lists (www.grainscanada.gc.ca) to determine the registration and grade eligibility status of varieties.

CDC Polarstar is available for contract identity preserved production offered through Prairie Malt Limited, Sapporo Breweries and CANTERRA SEEDS.

Forage yields of some varieties are listed in the Forage Crops section.

- 1 Values in brackets indicate row and type: 2 = two-row; 6 = six-row; B = blue aleurone; W = white aleurone (all others yellow); F = fodder.
- 2 Reactions given for old races of stem rust. All cultivars are susceptible to new race QCCJ. However, to date this has not caused widespread damage. Early seeding will generally reduce the likelihood of severe infection.
- 3 Fusarium head blight (FHB) infection is highly influenced by environment and heading date. Under high levels of the disease all varieties will sustain damage. Hulless barley typically has reduced levels of DON when compared to regular barley with similar levels of disease.

2012-13 Canadian Malting Barley Technical Centre Recommendations

These recommendations are based on the varieties expected to be selected by grain and malting companies for both domestic and export markets from the 2012 harvest. Seeding decisions should be based on agronomic considerations and feedback from your grain company representative, local elevator operators and malting companies. This list is published on behalf of the members of the CMBTC, and other companies that have provided their input. Varieties not listed are not recommended. The varieties are listed in descending order to the amount selected in 2011.

Recommended Two-Row Barley Varieties

VARIETY	SOURCE	DOMESTIC	EXPORT	MARKET DEMAND
AC Metcalfe	4	Established	Established	Stable Demand
CDC Copeland	4	Established	Established	Stable Demand
CDC Polarstar †	5	Limited	Limited	Stable Demand
Newdale	3	Established	Limited	Increasing Demand
CDC Meredith	4	Limited	Limited	Increasing Demand

Bentley, Major, Merit 57, Norman, Cerveza, CDC Kindersley and CDC Reserve are not yet being grown for the commercial market. Production is limited to quantities required for testing and market development. †CDC Polarstar is available only through a closed loop Identity Preserved program offered by Prairie Malt Limited/Sapporo Breweries and their agents.

Recommended Six-Row Barley Varieties

VARIETY	SOURCE	DOMESTIC	EXPORT	MARKET DEMAND
Legacy	1,2,3	Established	Established	Stable Demand
Stellar-ND	5	Limited	Limited	Stable Demand
Tradition	1,2,3	Established	Established	Declining Demand

Celebration, Innovation, CDC Mayfair and CDC Anderson are not yet being grown for the commercial market. Production is limited to quantities required for testing and market development. Please talk to your local malting company selector in regards to demand for CDC Battleford, Lacey and Robust.

The CMBTC recommends the use of Certified seed to ensure varietal purity and to increase opportunity for selection.

The following companies have pedigreed seed distribution rights for those varieties that are footnoted:

1-Viterra; 2- BARI-Canada; 3-FP Genetics; 4-SeCan; 5-CANTERRA SEEDS

Domestic as used in this publication, means barley selected for domestic processing into malt to supply domestic brewers as well as for malt destined for export. Export is that malting barley designated for markets outside of Canada including the U.S., shipped as unmalted grain

OATS

New for 2012

Variety	Code	Breeder	Distributor	Seed Availability
CDC Big Brown☉	OT3037	Crop Development Centre	SeCan	2014
CDC Morrison☉	OT3044	Crop Development Centre	CANTERRA SEEDS	2014
CDC Seabiscuit☉	OT3036	Crop Development Centre	CANTERRA SEEDS	2013

Varieties that are being tested or proposed for registration

OT2069☉ AAFC (Winnipeg)

Comments:

Forage yields of some varieties are listed in the Forage Crops section.

Producers are encouraged to check the "Preferred" or "Approved" lists available at most mills if they are selecting varieties for the milling market. These lists are updated as new genetics become available.

HiFi☉ is exceptionally high in beta-glucan fibre and is available for contract identity preserved production.

The supported line OT2069☉ appears to have improved resistance to Fusarium Head Blight, based on lower DON accumulation, in comparison with other recently registered varieties.

1 All varieties are susceptible to new races NA67 and NA76 and these races caused moderate damage to crops in the Red River Valley in 2001 and 2002.

Early seeding will generally reduce the likelihood of severe infection.

2 BYD = Barley Yellow Dwarf - a viral disease carried and spread by aphids - early seeding will generally reduce the likelihood of severe infection.

HULLESS OATS

Comments:

Hulless oats were last tested in 2008.

GEHL[®] is the first bald hulless oat variety as it does not have surface-borne hairs (trichomes). GEHL[®] also has improved hulless expression.

The yield of hulless oats is less than that of common oats in which the hull is part of the yield. Hulless oats should be stored at <12% moisture.

Hulless oats are a specialty product for which a market should be ensured prior to planting.

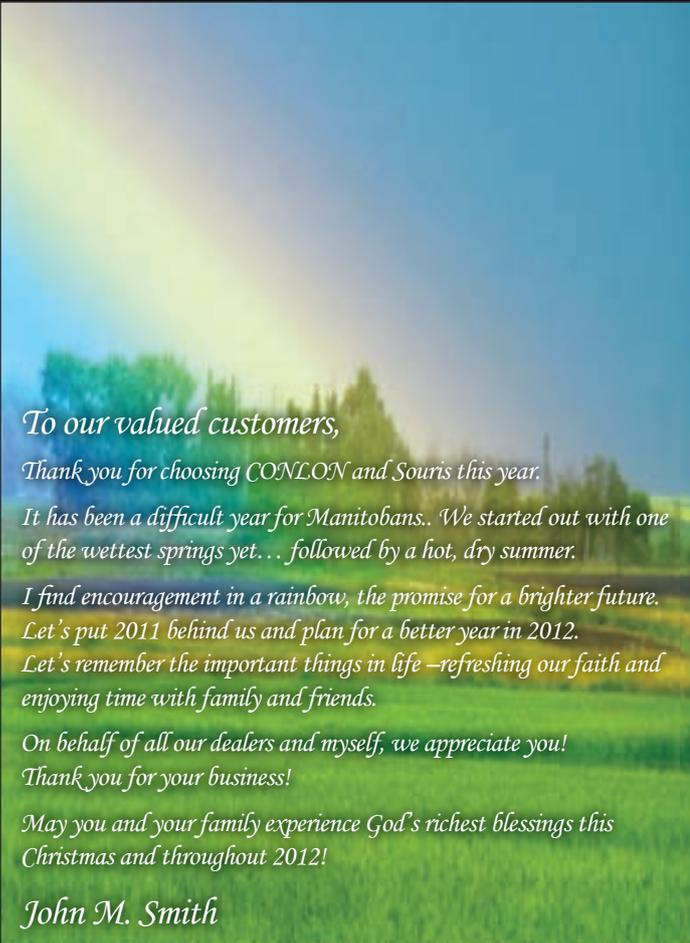

Crown rust races capable of attacking varieties with the Pc68 gene are now prevalent in Manitoba. This has resulted in varieties being redefined as Susceptible (S) for Crown Rust resistance. Early seeding may reduce the likelihood of severe infection.

To our valued customers,

Thank you for choosing CONLON and Souris this year.

It has been a difficult year for Manitobans.. We started out with one of the wettest springs yet... followed by a hot, dry summer.

I find encouragement in a rainbow, the promise for a brighter future.

Let's put 2011 behind us and plan for a better year in 2012.

Let's remember the important things in life –refreshing our faith and enjoying time with family and friends.

On behalf of all our dealers and myself, we appreciate you!

Thank you for your business!

May you and your family experience God's richest blessings this Christmas and throughout 2012!

John M. Smith

- ✓ **Highest Yielding Oat in Yield MB 2009**
(MB Crop Ins. Real Farm Yields)
- ✓ **Shorter Oat on the Market!**
- ✓ **Heaviest test weight with smaller seed**
- ✓ **Earliest – 3-4 days earlier than Ronald or Leggett**
- ✓ **Best crown rust resistance**
✓ resistant to stem rust
✓ resistant to loose and covered smut
- ✓ **Accepted by all Oat millers, ...Recommended by Quaker**

Comments:

The Canadian Grain Commission advises that the following wheat varieties belonging to the Canada Prairie Spring White (CPSW) class were deregistered effective April 28, 2011: **Snowwhite 475** and **Snowwhite 476**. Effective August 1, 2011, these varieties will only be eligible for the grade Wheat, Canada Western Feed.

The Canadian Grain Commission advises that the following wheat variety belonging to the Canada Western Red Spring (CWRS) class will be deregistered effective August 1, 2013: **Garnet**. After August 1, 2013, this variety will only be eligible for the grade Wheat, Canada Western Feed.

Producers are strongly encouraged to use a combination of the Canadian Food Inspection Agency's List of Registered Varieties (www.inspection.gc.ca) and the Canadian Grains Commission's Variety Designation Lists (www.grainscanada.gc.ca) to determine the registration and grade eligibility status of varieties.

1 Leaf Spots rating is a combination of resistance to tan spot, spot blotch and septoria leaf disease complex.

2 Fusarium head blight (FHB) infection is highly influenced by environment and heading date. Under high levels of the disease all varieties will sustain damage.

¹ Leaf Spots rating is a combination of resistance to tan spot, spot blotch and septoria leaf disease complex.

² Fusarium head blight (FHB) infection is highly influenced by environment and heading date. Under high levels of the disease all varieties will sustain damage.

Sclerotinia the hard way.

Sclerotinia is a costly disease for canola growers. Provincial disease surveys* indicate that **82%** of prairie acres are affected by it. Losses can easily top **\$30** per acre... almost **\$5000** per quarter section. Spraying to control sclerotinia is expensive and uncertain because it depends on critical timing.

Or the easy way.

There's a simple, certain and effective way to limit these losses. Plant canola seed with the Pioneer Protector® Sclerotinia trait. It puts your first line of defense against this costly disease right into the seed, to help protect your yield potential through to harvest. Control sclerotinia the easy way: **Pioneer Protector**.

PIONEER
BRAND · CANOLA SEED

*Science with Service
Delivering Success™*

www.pioneer.com

*Average number based on 88% affected in Manitoba, 91% in Saskatchewan and 64% in Alberta. Results from the Provincial Disease Surveys, 2010.

Field results show that Pioneer Protector® Sclerotinia resistance can reduce the incidence of sclerotinia in a canola crop by over 50%. Individual results may vary. Depending on environmental and agronomic conditions, growers planting Pioneer Protector Sclerotinia resistant hybrids may still require a fungicide application to manage sclerotinia in their crop.

CWGP	DH99W18I*45	Department of Plant Sciences, U of M
CWGP	DH99W19H*16	Department of Plant Sciences, U of M

Comments:

The Canadian Grain Commission has announced the varieties **CDC Kestrel**, **CDC Clair**, **CDC Harrier** and **CDC Raptor** will be moved from the Canada Western Red Winter class to the Canada Western General Purpose class August 1, 2013.

The Canadian Grain Commission plans to move **CDC Falcon** from the Canada Western Red Winter class to the Canada Western General Purpose class as of August 1, 2014, a year later than originally schedule. The transition period of **CDC Falcon** may be extended beyond August 1, 2014 if insufficient supplies of a new replacement variety with similar agronomic factors are commercially available.

Accipiter☉, **Peregrine**☉ and **Broadview**☉ are hard red kernel types, **Sunrise** is a soft red kernel type, and **CDC Ptarmigan** is a soft white kernel type.

The new variety **Flourish**☉ has improved resistance to Common Bunt over the currently available varieties.

1 Winter wheat varieties generally have poor genetic resistance to fusarium head blight. Earlier flowering of winter wheat relative to spring wheat may allow winter wheat to escape infection. The ratings provided are based on limited testing or performance in commercial fields.

2 All registered varieties have similar (good) winter hardiness if seeded at the optimum date into standing stubble where good snow cover can be assured. For the newer varieties of Flourish and Moats, there is limited information currently available. As these varieties are grown on more acres, a better understanding of relative winter hardiness will follow.

TRITICALE

Comments:

Triticale was last tested in 2000.

Triticale is used in Canada both as a food and livestock feed. Seed yield is generally higher than Glenlea wheat but protein content is slightly lower.

The newer available varieties, although susceptible, have reduced incidence of ergot compared to nonregistered varieties and rye.

Forage yields of some varieties are listed in the Forage Crops section.

Hate
wheat
midge?
Hate
spraying?

Farmers love this.

Prairie wheat growers are turning to midge tolerant wheat for midge control and high yields. And everyone wants this to continue.

That's the point of the Stewardship Agreement. The Agreement limits the use of farm-saved seed to one generation past Certified seed. It's a simple step that keeps the interspersed refuge system at the desired level, preventing a build-up of resistant midge. Protect your yields and grade, and preserve this important tool for years to come. What's not to love about that?

Contact your retailer or visit www.midgetolerantwheat.ca to learn more about these new varieties and how the interspersed refuge system works.

Watch your crops grow faster than ever before. The unique Vigor Trigger[®] effect of Cruiser Maxx[®] Cereals goes beyond insect and disease control, causing your plants to emerge faster, resulting in stronger plants and a higher return on your investment. Cruiser Maxx seed treatment also combines a powerful insecticide with two fungicides to protect your wheat and barley crops against early season disease and wireworm attack. It's available as a pre-mix to apply on-farm.

syngenta

For further information, please contact our Customer Resource Centre at 1-87-SYNGENTA (1-877-964-3682) or visit SyngentaFarm.ca

Farmer Funded Farmer Directed Research

Through the WGRF check-offs, producers have invested over \$57 million in the development and release of more than 100 new and improved wheat and barley varieties.

In fact, almost 70% of all wheat acres grown in Western Canada are WGRF supported varieties.

Part of your well-balanced farm business.

This Clearfield® tolerant variety offers early harvest, excellent yield, and great standability. Its short stature and excellent disease package makes **VR 5604HR CL** the popular choice for western Canadian wheat growers.

Let our service exceed your expectations

Many farmers. Many benefits.

They all agree.

It's unanimous. JumpStart® is making an impact in fields across western Canada. By releasing unavailable soil and fertilizer phosphate, and delivering increased root growth farmers are seeing earlier emergence, stronger, healthier plants, improved performance, and higher yields. Many farmers have discovered many benefits, but overall they all agree: JumpStart delivers.

JumpStart®

Enhancing Phosphate Fertility

Benefits farmers.

Novozymes is the world leader in bioinnovation. Together with customers across a broad array of industries we create tomorrow's industrial biosolutions, improving our customers' business and the use of our planet's resources. Read more at www.novozymes.com.

Variety Description Key

A CHECK CHARACTERISTICS box has been placed at the bottom of each table, to display the long term yield, # of site years, % oil content, maturity and any other check attributes.

Except for long term average yield, variety description information was obtained from the Co-operative Registration Trials.

Resistance to ratings: HS = highly susceptible; S = susceptible; MS = moderately susceptible; MR = moderately resistant; R = resistant; n/a = not available.

Site Years Tested is the cumulative number of locations over the years that a variety has been tested against the check variety. The more site years, the more dependable the data.

Ⓢ Indicates a variety that is protected by Plant Breeders Rights or a variety where protection has been applied for but not yet granted at time of printing.

TKW (Thousand Kernel Weight) is the weight in grams of 1000 seeds.

Key to 2011 Yield Tables

Yields derived over 2 or more growing seasons are the best indicator of variety performance. For new varieties, 2011 Average Yield over all sites is more reliable than data from a single location. Use single year data with caution.

CV % = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD = Least Significant Difference. Varieties must differ by the LSD to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

Soybean Comments

For specific notes regarding the soybean tables, refer to the SOYBEAN COMMENTS at the top of page 52.

Oilseed Crops

“Clearfield and canola
were made for each other.
Kinda like pork
and beans.”

For a waitress, Claire seems to know a lot about farming. Of course she learns all of it listening to the chatter at her diner. And this season, it's all about the **Clearfield**[®] Production System for Canola. It offers new higher-yielding hybrids, including Nexera[™] hybrids. But the big talk is about the unparalleled weed control shown by its new herbicide, ARES*. All for less than what you're using now. Visit clearfield.ca/canola, contact your BASF Retailer, or call AgSolutions[®] Customer Care at 1-877-371-BASF (2273) for more tempting nuggets.

*ARES herbicide is in the final stages of registration.

 **BASF**
The Chemical Company

Clearfield[®]
Production System for Canola

Always read and follow label directions.

AgSolutions is a registered trade-mark of BASF Corporation; ARES is a trade-mark, and Clearfield and the unique Clearfield symbol are registered trade-marks of BASF Agrochemical Products B.V.; all used with permission by BASF Canada Inc. Nexera is a trade-mark of Dow AgroSciences LLC. © 2011 BASF Canada Inc.

Canola Comments

The Variety Descriptions table summarizes the performance of registered canola varieties that will be available for planting in spring 2012. The post-registration Canola Performance Trial (CPT) testing in 2011 was designed to be more reflective of field practices. The appropriate herbicide products have been applied to the matching herbicide tolerant (HT) varieties in small plots, with no check variety assigned.

Performance at individual locations can be compared within the HT group and between groups, but the best performance indicator is to compare varieties over multiple sites. This also includes comparing performance of small plot trials with field scale trial results. The CPT information within Seed Manitoba 2012 and on-line, provides both data sources which have been reviewed through a protocol and data audit process. The data presented can be assured that it was collected and trials conducted in a scientific manner and comparisons are unbiased. With the changes in trial management and data source collection, data from 2011 is not considered comparable to previous trials. Detailed notes on other agronomic attributes of varieties and trials management are at www.canolaperformancetrials.ca

Data Sources

Data presentation in the long and mid season canola growing zones trials table (page 49) was collected from small plot, replicated trials, that are typically less than acre in size. Varieties have been entered by the representative marketing company for testing based on market share.

Field scale trials range from 0.5 to 1.5 acres in size and are managed by growers using their typical production practices. The trials are planted, swathed, harvested, and in some cases sprayed by growers using the respective herbicide systems according to established protocols. The performance results presented are those varieties that were also included in the testing under small plot, replicated trials. This data set is found on page 49.

Blackleg Rating for Canola

The rating represents blackleg tolerance relative to the highly susceptible variety Westar. Varieties with a resistant (R) or moderately resistant (MR) rating for blackleg have shown the greatest ability to suppress blackleg incidence and severity, but can still develop lesions or cankers. Individual field performance and reactions may vary from tolerance levels reported in the registration trials. In fields showing higher than expected levels of blackleg or where there has been history of a tight rotation with canola, it may be necessary to lengthen rotation to achieve sufficient blackleg control.

**ARE FLEA BEETLES A RISK
IN YOUR AREA THIS YEAR?**

THOUSANDS OF GROWERS MAY ALREADY KNOW THE ANSWER.

That's because they have discovered the benefits of
CANOLAWATCH

FLAX

Comments:

Flax was last tested in 2010.

All variety descriptions other than yield are based on data from the Flax Cooperative Trials in the Prairie Provinces.

AC Emerson demonstrates the greatest tolerance to flax chlorosis.

All varieties are immune to rust.

The Canadian Food Inspection Agency has provided notification in their Proposed List of Variety Registration Cancellations the oilseed flax varieties **CDC Mons** and **CDC Normandy** will be cancelled (deregistered) effective August 1, 2013.

¹ Oil quality of flax is based on the amount of linolenic acid measured in the seed or as measured by iodine value which is calculated from the fatty acid composition of the seed. A higher iodine value and/or higher ALA content indicates a higher overall oil quality in the seed.

² E = Excellent; VG = Very Good; G = Good; FG = Fair to Good; F = Fair; PF = Poor to Fair; P = Poor.

2011/2012 FARM FLAX SAMPLE TESTING

To ensure continued export market access for Canadian flax an Industry Stewardship Program has been introduced.

- Plant only seed that has been tested and is verified CDC Triffid-free. Any seed testing positive for CDC-Triffid must not be cleaned or planted.
- Keep the certificate of laboratory analysis that verifies the planted seed tested negative.
- As of September 1, 2010, any flax entering the commercial grain handling system will be subjected to rigorous testing for the presence of CDC Triffid before accepted for delivery. Some flax buyers will only accept results from certain labs. Please check with your grain buyer and the Flax Council of Canada (www.flaxcouncil.com) for more details.

SOYBEANS

NOTES FOR ALL SOYBEAN TABLES

Maturity Notes: Always Use More Than 1 Criteria to Evaluate Maturity.

- 1 Soybean varieties have been organized into 3 maturity zones - short, mid and long season areas. Although there are no variety restrictions, the short season grouping is meant to be a starting point for new growers in the outer production areas. The long season group is targeted for the southern Manitoba generally south of Highway 23, with the mid season grouping making up the bulk of the production area in between the short and long season area.
- 2 Company Crop Heat Unit ratings are assigned to assist growers select varieties suitable for their area. Unfortunately Company Heat Unit ratings do not always reflect the actual maturity in Manitoba. Growers should never rely on just 1 criteria for judging maturity. Experimental lines are not assigned a HU rating until they become registered.
- 3 Relative days to maturity (dtm) is the number of days from seeding to plant maturity (95% of the pods on the plant are mature with seeds rattling in the pods when plant is shaken) and is expressed as + or - days from the check. The upcoming 2012 growing season will see many new varieties with the advent of Genuity Roundup Ready 2 yield soybeans. Growers need to be cautious when using only one year data when evaluating maturity and yield. Using multiple year maturity data when available will give you a better indication on how a variety will mature with different growing seasons. Actual days to maturity for the check is found in the grey Check Box at the bottom of the table.

General Notes:

- 1 Roundup Ready and Conventional soybean varieties are evaluated separately, meaning direct comparison of varieties between different tables is not possible. All trials are solid seeded at 210,000 plants/acre.
- 2 Hilum colour can range from Yellow (Y), ImperfectYellow (IY), Grey (G), Brown (BR), Buff (BF) or Black (BL) and is solely a marketing issue. The hilum is the point on the soybean seed where it attaches to the pod.
- 3 Relative Seeds/lb, these were the seed numbers of the varieties entered into the trial. Soybean seed size can vary greatly between varieties and even from seed lot to seed lot of the same variety. Growers should use the seed size for their seed lot when calculating seeding rates.
- 4 Lodging is rated at harvest; 1=standing upright, 5= flat along the ground. A rating of 3 or more can promote white mold within the crop canopy.
- 5 Iron Deficiency Chlorosis (IDC) rating scores 1=green leaves, 2=yellowish leaves, 3=green veins with yellow leaves, 4=brown dead tissue between green veins, 5=severe chlorosis and a stunted growing point. Ratings were taken from 1 site prone to iron chlorosis over the last 2 years. IDC tolerant varieties are varieties with lower IDC Scores and perform better on soils prone to iron deficiency.
- 6 Iron Deficiency Chlorosis (IDC) grouping is used because varieties will have different visual rating scores from year to year. Numerical ratings which are close but are in different groupings will show similar symptoms. Both numerical and groupings should be considered together when judging IDC. Tolerant=leaves stayed green, Semi Tolerant=leaves when yellow then turned green, Susceptible= leaves went chlorotic and had dead patches on their leaves and were often stunted.
- 7 Soybeans are not eligible for MASC Production Insurance in all parts of the province - consult your local agent for more details.

WESTERN MANITOBA SOYBEAN ADAPTATION TRIAL

Comments:

The Adaptation Soybean variety trial was tested and the data donated by Manitoba Pulse Growers Association.

Soybeans do not qualify for MASC Production Insurance at Roblin or Hamiota.

Bulletin Boards are for things you want everyone to see

Here's what's on ours...

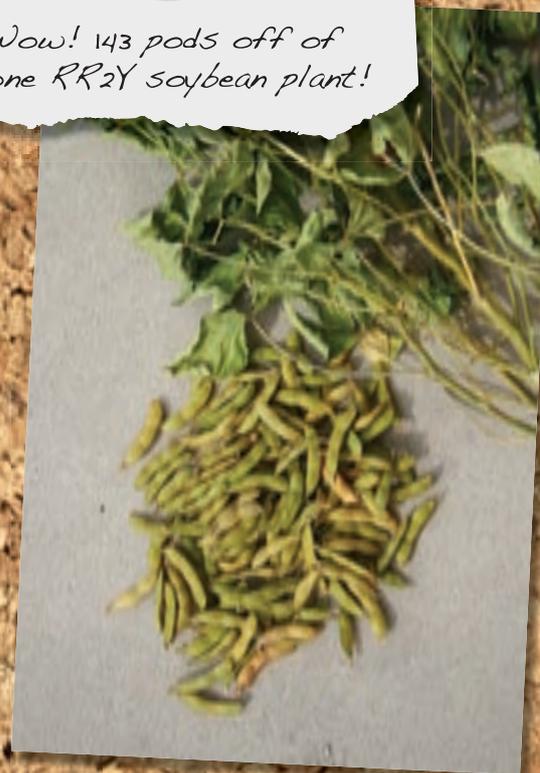

Dear NorthStar Genetics Manitoba,
The RR2Y soybeans are just better-period. The yields are higher, as the industry (and you guys) expected. But what is really impressive, is the plant vigor and the ability to handle stressful conditions.

-Roger Weinlaeder.

The main reason Oak Bluff Colony grows NorthStar Genetics beans is because of the strong relationship with the NorthStar Genetics dealer. I trust his advice 100%. Sometimes I phone him everyday for advice on varieties, planting equipment, and soils...any information like that.

-Sam Waldner

Wow! 143 pods off of one RR2Y soybean plant!

NATTO SOYBEANS

Comments:

The Natto Soybean variety trial was tested and the data donated by Manitoba Pulse Growers Association.

OAC Prudence is not a natto type soybean; it is used as a check to determine the yield potential of natto type soybeans compared to conventional soybeans.

Plan to grow.

Seed Manitoba gets you started.

Seed Interactive takes you to the next level

Seed Manitoba is your trusted source for variety selection in this province. Seed Interactive lets you tailor the results for your farm.

Use Seed Interactive to Your Advantage

- Select the locations and years that best compare with your farm
- Choose your own check
- Compare the varieties you want to compare

With Seed Interactive, you can compare multiple varieties, multiple years and multiple locations. It's easy and informative.

Log on to customize selections for your farm.

ELITE PERFORMERS GET RESULTS

NEW SOYBEAN VARIETIES FOR 2012

Pekko R2, ideal for shorter season zones, is the earliest maturing RR2Y soybean on the market. Choose it for reliable, secure yields.

Sampsa R2, best suited to the Red River Valley, offers outstanding performance, excellent standability and high yields.

In the end, it all comes down to performance, and BrettYoung brings a new standard of soybean excellence to the field.

Genuity® Roundup Ready 2 Yield® technology averages 11.2% higher yields, meaning more beans per pod, and more bushels per acre.*

Whichever way you – it's BioStacked®!

Nodulator® N/T soybean inoculants are BioStacked®. BioStacked® means greater plant vigour, root biomass and more nitrogen-fixing nodules on every plant. Which in turn means increased performance, superior Return-on-Investment and most importantly, added yield potential.

Designed for increased crop performance under Manitoba growing conditions, Nodulator® brand inoculants are available in BioStacked® liquid and BioStacked® sterile peat formulations, or our **unique Spherical Granules**.

Whichever way you go, Nodulator® inoculants are quite simply the best investment you can put into your beans.

1 % Nutmeat measurement taken from samples harvested at Morden location trials. One year, one location only data.

2 Average height and maturity derived from data collected in the MCVET Sunflower trials in 2009-2011 and the MSC trials. Data from all sites accepted for yield.

3 Reaction indicated is to Races 2, 3, and 4 under controlled indoor conditions.

4 Reaction indicated is to Race 2.

Exceed your growth potential.

A Manitoba Crop Variety Decision Tool

Seed Manitoba gets you started.

Seed Interactive takes you to the next level

Seed Manitoba is your trusted source for variety selection in this province. Seed Interactive lets you tailor the results for your farm.

Use Seed Interactive to Your Advantage

- Select the locations and years that best compare with your farm
- Choose your own check
- Compare the varieties you want to compare

With Seed Interactive, you can compare multiple varieties, multiple years and multiple locations. It's easy and informative.

Log on to customize selections for your farm.

PROCESSING IN DELORAIN, MB SINCE 1996

A BETTER BURN CAN IMPACT WHAT YOU EARN.

CleanStart[®] from Nufarm

The only non-residual burndown for pulses and canola.

Get rid of tough weeds before seeding to give pulses and canola a better head start. CleanStart takes burndown to the next level – tackling weeds that glyphosate doesn't.

- **Controls spring-germinating dandelions, ALL volunteer canola and kochia.**
- **Burns off all emerged weeds controlled by glyphosate.**
- **Significantly faster burndown than glyphosate.**

CleanStart[®] is a registered trademark of Nufarm Agriculture Inc.

Leaders in off-patent solutions.

VT500G

**Yields big.
Stands strong.**

Viterra's big yielding GENRR canola hybrid, **VT500G**, is the direct result of our own robust breeding program. The prefix **VT** means that this hybrid is bred by Viterra with the exclusive science and technology of **VT Genetics**. With VT500G you get the power of an elite performer that stands strong and delivers big yields. *Visit seed.viterra.ca to find out more.*

2011 Viterra Canola Trial Data now available at seed.viterra.ca.

ELIMINATE OVERLAPS
SAVE ON INPUT COSTS
GET BETTER YIELDS

Seed Hawk's legendary Sectional Control™ (SCT) technology is an innovative way to eliminate overlaps and save on input costs. SCT™ works in conjunction with GPS and autosteer to lift openers when seeded ground is encountered and shut down metering of seed and fertilizer. It's a precise way to reduce ground disturbance and the doubling up of your inputs. The result is even emergence and proven seed and fertilizer savings.

...but don't just take our word for it

"You get uniform emergence and it seems like every seed wants to grow. By using our three SCT equipped Seed Hawk drills, I believe we've probably saved about 8.5% on our seed and fertilizer. In 2010 this translated into about \$170,000 in savings for our farm – more than enough to pay off our original \$150,000 investment in SCT."

Guy Cadrain, Leask, Saskatchewan

SCT delivered great ROI for Cadrain. To start saving on input costs, order your Seed Hawk now to qualify for best pricing and guaranteed spring delivery. See your local dealer or visit seedhawk.com and discover what SCT can do for you!

Variety Description Key

A CHECK CHARACTERISTICS box has been placed at the bottom of each table to display the long term yield, # of site years, % protein and any other check attributes.

Except for the long term average yield and protein data, variety description information was obtained from the Co-operative Registration Trials.

Resistance to ratings: VG = Very Good; G = Good; F = Fair; P = Poor; VP = Very Poor; n/a = not available

Site Years Tested is the cumulative number of locations over the years that a variety has been tested against the check. The more site years the more dependable the data.

☉ Indicates a variety that is protected by Plant Breeders Rights or a variety where protection has been applied for but not yet granted at time of printing.

TKW (Thousand Kernel Weight) is the weight in grams of 1000 seeds.

Key to 2011 Yield Tables

Yields derived over two or more growing seasons are the best indicator of variety performance. For new varieties, 2011 Average Yield over all sites is more reliable than data from a single location. Use single site year data with caution.

CV% = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD% = Least Significant Difference. Varieties must differ by the LSD% to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

Special Crops

NEW CORN GENETICS TAKE FLIGHT

New corn hybrids from the DEKALB® brand offer the latest development in early maturing options with higher yield potential, including DKC27-55 which is backed by the Genuity®VT Double PRO™ stacked traits.

And all products have been FACT™ tested in field conditions by growers like you. Supplies are limited, so get yours while you can. Visit DEKALB.ca for trial results this Fall.

Before opening a bag of seed, be sure to read, understand and accept the stewardship requirements, **including applicable refuge requirements for insect resistance management**, for the biotechnology traits expressed in the seed as set forth in the Monsanto Technology Stewardship Agreement that you sign. By opening and using a bag of seed, you are reaffirming your obligation to comply with the most recent stewardship requirements.

Monsanto Company is a member of Excellence Through Stewardship™ (ETS). Monsanto products are commercialized in accordance with ETS Product Launch Stewardship Guidance, and in compliance with Monsanto's Policy for Commercialization of Biotechnology-Derived Plant Products in Commodity Crops. This product has been approved for import into key export markets with functioning regulatory systems. Any crop or material produced from this product can only be exported to, or used, processed or sold in countries where all necessary regulatory approvals have been granted. It is a violation of national and international law to move material containing biotech traits across boundaries into nations where import is not permitted. Growers should talk to their grain handler or product purchaser to confirm their buying position for this product. Excellence Through Stewardship™ is a service mark of Excellence Through Stewardship. ALWAYS READ AND FOLLOW PESTICIDE LABEL DIRECTIONS. Individual results may vary, and performance may vary from location to location and from year to year. This result may not be an indicator of results you may obtain as local growing, soil and weather conditions may vary. Growers should evaluate data from multiple locations and years whenever possible. Roundup Ready® crops contain genes that confer tolerance to glyphosate, the active ingredient in Roundup® agricultural herbicides. Roundup® agricultural herbicides will kill crops that are not tolerant to glyphosate. Roundup Ready® crops contain genes that confer tolerance to glyphosate, the active ingredient in Roundup® brand agricultural herbicides. Roundup® brand agricultural herbicides will kill crops that are not tolerant to glyphosate. GRAIN CORN

Comments:

The 2011 grain corn hybrid trials were tested and the data donated by the Manitoba Corn Committee.

The trial locations for 2011 were Carman, Reinland, MacGregor, St.Pierre and Melita. However, only Reinland and St.Pierre data was available for publication. Carman site data will be available online at www.seedmb.ca in January.

All hybrids are evaluated at a plant population of 26,000 plants per acre. Plots are planted at a higher rate and thinned to achieve the target population. Reinland was planted May 25 & St.Pierre May 20.

Reinland was harvested October 6 & St.Pierre October 15.

The data presented is for one year only. Use with caution.

The Manitoba Corn Committee publishes the annual results with all locations along with long term data in their brochure, which is available at the Manitoba Corn Grower's Association office (204-745-6661) and at local Manitoba Agriculture, Food & Rural Initiatives offices.

1 Each company assigns a corn heat unit (CHU) rating to each of their hybrids. The CHU rating is a measure of relative maturity and is one criteria for choosing a hybrid which will mature in your area. Moisture content at harvest, density, and days to 50% silk are other measurements to look at when evaluating the relative maturity of a hybrid.

2 Traits: BT, HX1, CB, YGCB, VT3 - resistance to European corn borer; RR, RR2 - Roundup herbicide tolerant; GT - glyphosate herbicide tolerant; LL - Liberty herbicide tolerant; YGRW, RW - resistance to rootworm; SSTX - SmartStax.

3 Moisture content at harvest.

Growing wiser.

Seed Manitoba gets you started.

Seed Interactive takes you to the next level

Seed Manitoba is your trusted source for variety selection in this province. Seed Interactive lets you tailor the results for your farm.

Use Seed Interactive to Your Advantage

- Select the locations and years that best compare with your farm
- Choose your own check
- Compare the varieties you want to compare

With **Seed Interactive**, you can compare multiple varieties, multiple years and multiple locations. It's easy and informative.

Log on to customize selections for your farm.

1 Traditionally tannin fababean tan coloured seed coats contain tannins and can't be fed directly to livestock. Zero tannin fababeans have white seed coats and can be fed directly to livestock.

FIELD BEANS — Western Manitoba Adaptation Trials (formerly called Narrow Row trials)

Comments:

Long term yield data and days to maturity are from Manitoba Pulse Growers Association Trials grown in 10 to 12 inch row spacing.

More detailed measurements from the trials are available to MPGA members and will be distributed in the December Special Edition of the Pulse Beat magazine.

Days to maturity is critical. Do not select a variety that will not mature in time, under normal growing conditions. Early fall frost severely affects yield and quality.

Consult your local MASC agent for information on insurability of edible beans in your area.

FIELD BEANS — Wide Row Trials

Varieties or Lines Tested for the First Time in 2011

Navy: 07073,NA06-002

Pinto: 06185,06189,06185,06189,Sinaloa,PIN DJ09-1012,C6V-1237

Black: 04352,06253

Yellow: 08560863

Comments:

Individual site and more detailed measurements from these trials are available to Manitoba Pulse Growers Association (MPGA) members and are distributed free in the Winter Edition of the Manitoba Pulse Beat to all MPGA members in good standing.

Long term yield data and days to maturity are from Manitoba Pulse Growers Association Trials conducted by Agriculture and Agri-food Canada. Results are from row crop trials located at Morden, Portage, Carman/Graysville, and Winkler/Plum Coulee sites.

Days to maturity is critical. Do not select a variety that will not mature in time, under normal growing conditions. Early fall frost severely affects yield and quality. Consult your local MASC agent for information on insurability of edible beans in your area.

1 Long term average yield is the best indicator of variety performance. Use single site-year data with caution.

2 Due to different weather conditions each year, the actual number of days it takes a variety to fully mature varies from year to year. Choosing a variety that needs a longer growing season than your farm has increases the risk of frost damage and lower returns.

3 Variety did not fully mature at 1 or more sites.

INDUSTRIAL HEMP

Comments:

A licence from Health Canada is required to grow Industrial Hemp.

THC testing for some varieties is required.

Please check Health Canada's List of Approved Cultivars (www.hc-sc.gc.ca) to determine status of varieties.

DON'T JUST PERFORM... OUTPERFORM

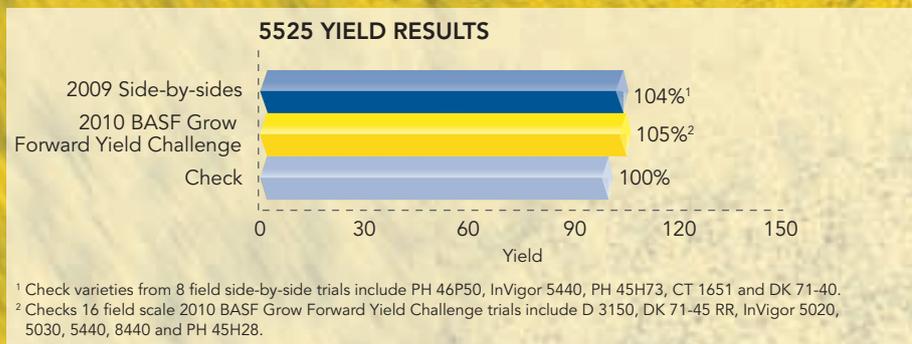

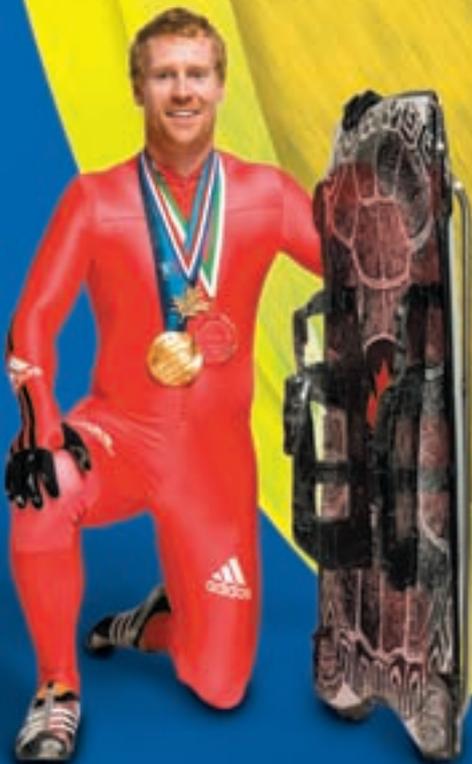

5525 CL COMES THROUGH LIKE A CHAMPION

5525 CL, for mid to long season zones, consistently outperforms all Clearfield® competitors and challenges the yields of top varieties in any system.

BrettYoung's newest Clearfield addition, 5535 CL, is the yield leader in short season zones, making this newcomer a top performer.

In the end, it all comes down to performance, and BrettYoung brings a new standard of excellence to the field.

brettyoung.ca 800-665-5015

"In any field, a gold medal performance is a result of preparation, hard work and unwavering support."

JON MONTGOMERY

2010 Olympic Gold Medalist – Skeleton
2008 World Championship Silver Medalist

LENTILS

Comments:

The lentil variety trials were tested by the Manitoba Pulse Growers Association. However, no sites were harvested as excess moisture early in the year impacted stand establishment.

Clearfield lentils are tolerant to the herbicide Odyssey. These varieties are easily identified by the "CL" designation at the end of the name.

¹ Ratings determined in Saskatchewan and may not be accurate under wetter growing conditions present in Manitoba.

Manitoba
Pulse Growers
Association Inc.

MPGA has been a proud MCVET sponsor supporting pulse post-registration variety trials for the last 14 years.

MPGA and the Agri-Food Research and Development Initiative (ARDI) have worked together to evaluate dry bean, soybean, pea, faba bean and lentil at sites all across Manitoba.

Working for You

For more information on how your check-off dollars work for you visit www.manitobapulse.ca

Comments:

All varieties are rated resistant tolerance to blackleg.

Data is donated and approved for publication by the Prairie Recommending Committee for Oilseeds (PRCO).

Minimum Damage MAXIMUM GERMINATION

BATCO MANUFACTURING

Batco Belt Conveyors minimize impact damage, protecting the grade quality and germination performance of your delicate seed.

Batco manufactures Long Conveyors, Field Loaders, Low-Profile Transfers, Pit Stops and custom conveying options.

Maximize your upload speeds with our wider belt. Batco's new 2400 series with 24" belt width increases your handling capacity up to 14,000 bu/hr.

AGI
AG GROWTH INTERNATIONAL

How can my farm benefit from **Seed Interactive**?

Cutlass is the **field pea** check variety in Seed Manitoba, but I want to compare with **Eclipse**, the variety I've grown on my farm. How can I do that?

SEED Interactive Advantage:
Choose your own check.

Seed Interactive allows you to select varieties suited to the agronomic and management practices on your farm. Use the **Variety Characteristics Report** to generate an overall summary using all data, or to compare disease resistance and general agronomic performance.

Use the **Yield Comparison Report** to compare two varieties at the same location. With both reports, choose your own check variety. It's easy and informative. Log on to customize selections for your farm. www.seedinteractive.ca

**When you choose to partner with us,
you grow with us.**

Partnering with Richardson Pioneer gives you a distinct advantage in the field. Our passion for agriculture comes through in the way we support producers throughout the entire growing cycle. At Richardson Pioneer, our professional agronomists and Certified Crop Advisors use a combination of in-field testing, advanced technology, and hands-on experience to help you maximize your farm's profit.

In addition to our field-level agronomic support, Richardson Pioneer's grain merchandising team has a wide range of expertise that makes bringing your grain to market as easy as possible. We work with you, on your farm, to create personal plans that fit the needs of your business.

**Contact your local Richardson Pioneer
Ag Business Centre today to get started.**

GROW WITH US

How can my farm benefit from **Seed Interactive**?

Fusarium resistance is a big consideration in choosing wheat for my farm in the Red River Valley. Seed Manitoba tells me which varieties are moderately resistant (MR). Can I compare long-term yield of those varieties along with other agronomic or **disease resistance** information?

SEED Interactive Advantage:
Compare the varieties you want to compare.

Seed Interactive allows you to select varieties suited to the agronomic and management practices on your farm. Use the **Variety Characteristics Report** to generate an overall summary using all data, or to compare disease resistance and general agronomic performance.

Use the **Yield Comparison Report** to compare two varieties at the same location. With both reports, choose your own check variety. It's easy and informative. Log on to customize selections for your farm. www.seedinteractive.ca

SEED
INTERACTIVE.CA

*A Manitoba Crop
Variety Decision Tool*

Variety Description Key

Except for long term average yield and quality data, variety description information was obtained from the Co-operative Registration Trials.

Disease Resistance ratings: (HS) highly susceptible; (S) susceptible; (MS) moderately susceptible; (MR) moderately resistant; (R) resistant; (n/a) not available.

☉ Indicates a variety that is protected by Plant Breeder's Rights or a variety where protection has been applied for but not yet granted at time of printing.

* Seed sources can be found at the back of the forage section.

Key to 2011 Yield or Quality Tables

Numbers in brackets indicate site years. Site Years Tested is the number of locations added up over the years that a variety has been tested in trials against the check. The more site years the more dependable the data. Use data with caution when there are fewer than 3 site years for annual crops and 9 site years for perennial crops.

CV % = Coefficient of Variation. A measure of random variation in a trial. A small % CV is desirable.

LSD % = Least Significant Difference. Varieties must differ by this percentage to be considered significantly different from one another.

Forage Crops

Some things have changed,

some haven't.

Manitoba farmers are still producing some of the world's finest crops and livestock, and we're bringing them the information to help them do it even better.

RECORD HIGH BID | **Edsel of tractors sells for a record price**
There's more than one way to make money with a tractor

By Lorraine Stevenson
CO-OPERATOR STAFF

International Harvester's M18-35 Titan tractor was a dud when it first hit the market in the early 1900s. But now it's worth as much as a brand new one.

The rare vintage tractor restored by a MacGregor-area farmer has fetched what's believed to be the highest price ever paid for a collector tractor in Canada — a cool \$375,000.

"You could have heard a pin drop before they said 'sold,'" said Bob Anderson, who rebuilt the 1913 Model 18-35 Titan in the late 1970s from a pile of parts and skeleton.

The Aug. 1 sale of Anderson's collection of 18 McCormick vintage farm equipment dating back to the 1800s attracted more than 200 bidders from

Manitoba Agriculture, Food and Rural Initiatives Variety Guide

FORAGE CULTIVAR EVALUATION

The Manitoba Forage Council operates the Forage Cultivar Evaluation Program. Management of the program is through an industry team approach. Producers, seed trade, extension and researchers are involved in the forage evaluation management committee.

The perennial forage cultivar evaluation is coordinated with similar programs in Saskatchewan and Alberta, allowing for sharing of test data. The annual forage testing is coordinated with other testing facilities and producer organizations.

The testing sites are Arborg, Melita, Rosebank (formerly Neepawa), Roblin and St. Adolphe (formerly St. Pierre Jolys). Cooperation and support from program partners have allowed the efficient operation of testing in 2011.

The objective of the evaluation program is to provide information to Manitoba's forage producers and industry partners on the performance of annual and perennial forage cultivars under Manitoba conditions. The program measures dry matter yields of perennials under a three-cut system

over three production years and annuals under a one-cut system over 3 years. The program has also developed test procedures to evaluate persistence, winter-hardiness and grazing tolerance.

The Manitoba Forage Council publishes results from the forage evaluation trials with detailed information on forage production. These reports are available from Manitoba Agriculture, Food and Rural Initiatives (MAFRI) offices, MAFRI Forage specialists, Rangeland and Pasture specialists, and the Manitoba Forage Council.

Support for Forage Cultivar Evaluation was obtained from various sectors of the agricultural industry. In appreciation of their partnership in this program, the following sponsors are acknowledged:

Manitoba Agriculture, Food and Rural Initiatives
Agricultural Sustainability Initiative
Green Cover Program – Agriculture and Agri-Food Canada
Viterra

FORAGE ADAPTATION & COMPARISON GUIDE

LEGUMES

Forage	Use	Longevity	Winter Hardiness	Tolerance to:			Preferred Climate and Growing Conditions
				Drought	Flooding	Salinity	
Alfalfa	Hay & Pasture	Long	Good	Good	Low	Low to Moderate	Widely adapted to most Manitoba soils but will not tolerate areas that have periodic flooding.
Alsike Clover	Hay & Pasture	Short	Fair	Poor	Moderate	Low	Prefers low-lying moist areas.
Birdsfoot Trefoil	Pasture	Long	Good	Moderate	High	Low to Moderate	Prefers moist areas.
Cicer Milkvetch	Pasture	Long	Good	Moderate to High	Low	Moderate	Widely adapted but exhibits its creeping habit best on more coarse textured soils.
Red Clover	Hay & Pasture	Short	Poor	Low	High	Low	Best suited to humid areas with moderate temperatures.
Sainfoin	Pasture	Long	Fair	High	Low	Low	Best on brown and dark brown soil areas. In very dry areas it yields poorly. Does well on thin gravelly soils.
Sweet Clover	Hay & Silage	2 years	Fair	Moderate to High	Low	Moderate	Especially productive on fertile soils.

TAME GRASSES

Altai Wild Ryegrass	Pasture	Long	Excellent	High	Low	Very High	Loam & clay soils best - but grows on a wide range of soils. Doesn't appear adapted to Manitoba conditions.
Annual (Italian) Ryegrass	Hay & Pasture	Short annual 1 year	Poor	Low	High	Low	Produces best on soils of medium to high fertility and grows best with adequate moisture.
Creeping Foxtail	Pasture	Long	Good	Low	High	Moderate	Adapted to areas where reed canarygrass grows well and soil moisture is continually available.
Creeping Red Fescue	Pasture Lawn	Long	Excellent	Moderate	Moderate	Low	Does best in high rainfall areas. Will grow in wide range of soil types.
Crested Wheatgrass	Hay & Pasture	Long	Excellent	Moderate to High	Low	Low to Moderate	Adapted to dry areas with good soils but will also establish on lighter soils.
Dahurian Wild Ryegrass	Pasture	Short	Good	Moderate	Low	High	Adapted to all soil zones.
Intermediate Wheatgrass	Hay & Pasture	Short to Medium	Good	Moderate to High	Low	Low	Well drained soils with ample moisture.

FORAGE ADAPTATION & COMPARISON GUIDE — Grasses (continued)

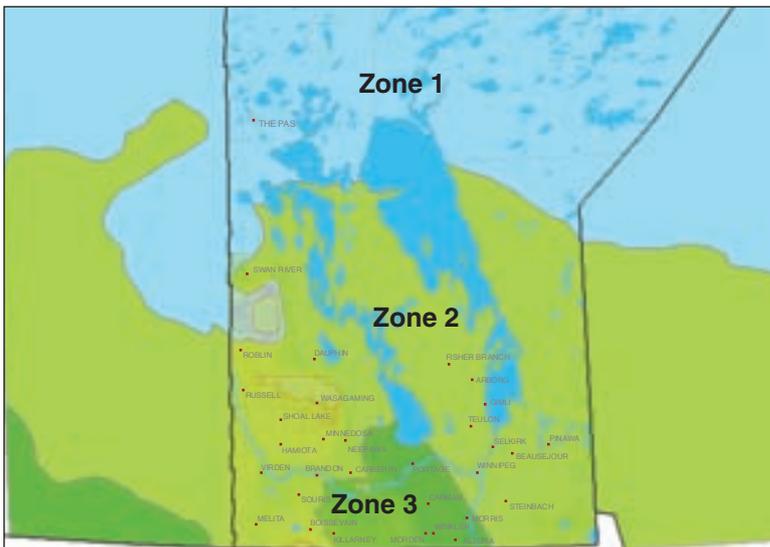

Forage	Use	Longevity	Winter Hardiness	Tolerance to:			Preferred Climate and Growing Conditions
				Drought	Flooding	Salinity	
Kentucky Blue Grass	Pasture Lawn	Long	Excellent	Moderate	Moderate	Low	Prefers cool and humid. Grows on most soils.
Meadow Bromegrass	Hay & Pasture	Long	Good	High	Low	Low	Grows well on most soils where Smooth Brome does well.
Meadow Fescue	Pasture	Short - Medium	Good	Moderate	High	Low to Moderate	Prefers soil with good moisture and good drainage.
Meadow Foxtail	Pasture	Long	Good	Low	High	Low	Prefers cool moist conditions. High water table.
Orchard grass	Hay & Pasture	Short	Fair	Moderate	Low to Moderate	Low	Prefers moist conditions. Sandy soils are too dry for good growth unless in high rainfall area.
Perennial Ryegrass	Hay & Pasture	Short 2-3 years	Poor	Low	Low	Low	Needs high precipitation and fertility for high yields. Adapted to wide range of soils.
Pubescent Wheatgrass	Hay & Pasture	Medium	Good	Moderate to High	Low	Low to Moderate	Widely adaptable to precipitation, temperature, elevation, and low fertility soil.
Russian Wild Ryegrass	Pasture	Long	Excellent	Very High	Low	Very High	Can be grown on a wide range of soils. Most productive on fertile loams.
Smooth Bromegrass	Hay & Pasture	Long	Excellent	Moderate	Moderate	Low to Moderate	Well adapted to all soils in Manitoba.
Tall Fescue	Pasture	Medium	Good	Moderate	Moderate to High	High	Variety of soils. Does well on wet, poorly drained soils.
Tall Wheatgrass	Hay & Pasture	Medium	Excellent	Low	High	High	Adapted to saline and imperfectly drained alkali soils.
Timothy	Hay & Pasture	Medium	Good	Low	High	Low	Cool moist areas with good drainage.

NATIVE GRASSES

Awned Wheatgrass	Hay & Pasture	Medium	Good	Moderate	Moderate	Low to Moderate	Prefers moderately sandy to loam soils with good moisture and drainage. Found in moist flats, meadows and low growing bushes.
Big Bluestem	Pasture	Long	Good	Low to Moderate	Moderate	Low to Moderate	Grows under a wide range of conditions.
Green Needlegrass	Pasture	Long	Good	High	Moderate	Low to Moderate	Performs best on medium to heavy textured soils. Prefers moist sites with good drainage.
Little Bluestem	Pasture	Long	Good	High	Low	Moderate	Sandy, gravelly soils with shallow water table or where snow accumulates. Common on prairie upland.
Northern Wheatgrass	Pasture	Long	Good	Very High	Moderate	Moderate	Prefers medium to coarse textured soil.
Prairie Cord Grass	Hay & Riparian	Long	Good	Low to Moderate	High	Low to Moderate	Wide range of soils (sand to clay) - does best on seasonally dry areas, marsh edges, wet meadows, drainageways.
Reed Canarygrass	Hay & Pasture	Long	Good	Moderate	Very High	Low	Moist cool climate. Poorly drained areas subject to temporary flooding.
Side Oats Grama	Hay & Pasture	Long	Good	Moderate to High	Low	Low to Moderate	Adapted to a range of soils. Performs best on fine textured soils. Found on rocky ridges, open grasslands and hillsides.
Slender Wheatgrass	Hay & Pasture	3-5 years	Good	Moderate	Moderate	High	Widely adapted - prefers sandy loams.
Switch grass	Pasture	Medium	Fair	Low	Moderate	Moderate	It has potential for good summer pasture when enough moisture. Grows best on loam and sandy loams.
Western Wheatgrass	Hay & Pasture	Long	Excellent	High	Moderate to High	High	Widely adapted - prefers heavy moderately alkaline soil. Tolerates periodic flooding.

Source: Manitoba Agriculture Food and Rural Initiatives – Forage Adaptation & Comparison Guide

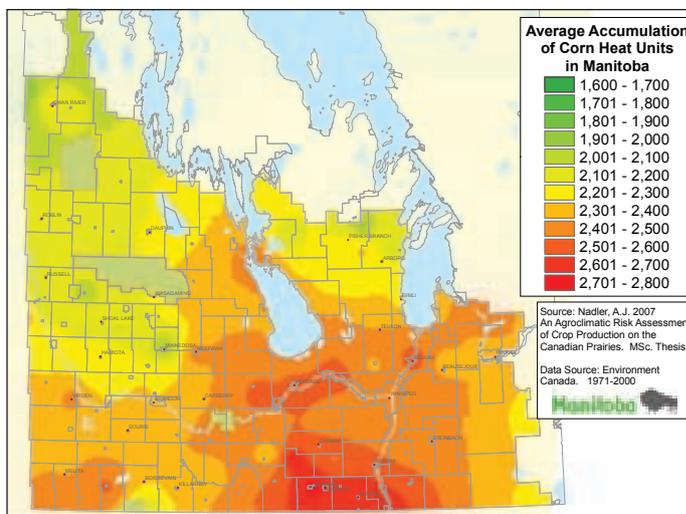

ALFALFA WINTER HARDINESS

This Plant Hardiness Zones (2000) map outlines the different zones within Manitoba where various types of plants (including alfalfa) will likely survive the winter. It is based on 30-year average climatic conditions of each area (min. and max. temperatures, frost-free period, summer and January rainfall, snow cover, wind speed, elevation). Hardiness Zone ratings are to be used only as guideline when selecting varieties as many factors influence overwintering ability (such as snow cover, timing of cold weather, location of plants in the landscape, relative health of plants as they enter winter). Always use optimum management techniques to ensure winter survival when choosing a variety with slightly poorer overwintering rating.

CORN HEAT UNIT ACCUMULATION

Corn heat units (CHU) are closely related to corn development. CHU is better than calendar days or growing degree days because CHU's only accumulate when night temperatures are above 4.4°C and day temperatures above 10°C, and maximum growth occurs at 30°C and decreases with higher temperatures. The map above indicates 30-year average accumulation of CHU in varying regions in the province.

Helping Unlock the Potential of Seed

Agri-Food Research and Development Initiative (ARDI) is proud to invest in seed trials to help Manitoba farmers choose the right varieties for their farms.

To view other projects funded by ARDI, visit our website.

Aider à découvrir le potentiel des semences

L'Initiative de recherche et de développement en agroalimentaire (PRDA) investit fièrement dans des essais de semences afin d'aider les agriculteurs manitobains à choisir les bonnes variétés de cultures pour leurs exploitations.

Pour découvrir d'autres projets financés par l'PRDA, visitez le site Web.

This land is *your* land.

On 60,000 farms and 20 million acres across Canada,
the name SeCan is trusted for exceptional seed value.

Canadian farmers plant SeCan genetics
on more acres than any other seed brand.
SeCan is not a seed company. As "Canada's
Seed Partner", we're a not-for-profit member
association that has returned more than
65 million dollars to Canadian plant breeders.

Genes that fit *your farm*® is a registered trademark of SeCan.

This land is *your* land.
And these are *your* genetics.

Call your SeCan seed retailer for genes
that fit *your* farm.

SeCan
Canada's Seed Partner

Yellow (AC Prairie Gold)	20	Yellow	70-90,000	75	50-60		

- 1 Values in brackets indicate row and type: 2 = two-row; 6 = six-row; W = white aleurone (all others yellow); F = fodder.
- 2 Quality is highly dependent on plant maturity at harvest. For optimum quality: harvest barley at early-mid dough stage; oats & triticale at milk-early dough stage; peas at early pod formation; millet at early heading.
- 3 Resistance to leaf diseases can improve forage quality and yield: (R) Resistant; (MR) Moderately Resistant; (I) Intermediate; (MS) Moderately Susceptible; (S) Susceptible; (n/a) = not available. See cereal & special crop section in of this guide for more detail of crop tolerances.
- 4 All varieties are susceptible to new races of NA67 and NA76. These races caused moderate damage to crops in the Red Valley in 2001 & 2002.

- 30HP KOHLER
- UPTO 700 BU/HR
- HOSES INCLUDED
- LESS DAMAGE THAN AN AUGER!

Yellow (AC Prairie Gold)	102 (10)	95 (1)	100 (3)	— —	91 (3)	121 (3)	99	10.5	61	836	(3)
Check - Crown average Dry Matter yield 4639 lb/ac (5195 kg/ha) over 10 site years.											

1 Check varieties for cereal crops depends on the year tested. Virden: 8788 lb/ac (9841 kg/ha) over 28 site years; AC Ranger yield: 6292 lb/ac (7046 kg/ha) over 24 site years; Triple Crown 9927 lb/ac (11,117 kg/ha) over 34 site years; Banjo 10,148 lb/ac (11,366 kg/ha) over 14 site years. Forage Pea check 40-10 with an average yield of 9192 lb/ac (10,320 kg/ha) on 22 site years. Data collected over 6 years (2003-2008) on six sites: Arborg, Roblin (MB), Sutherland, Floral (SK), Lacombe, Edmonton (AB).

2 Forage quality: Barley, Oats, Triticale average values from a Manitoba Forage Council test from 2005-2010 on 4 sites (Arborg, Melita, Roblin, Rosebank). Peas average values from 2006-2007 on 2 sites (Roblin and Arborg).

3 Relative Feed Value (RFV), Crude Protein (CP), Total Digestive Nutrients (TDN). Beef, is an estimation of pounds of beef produced under optimum feeding conditions using a rule of thumb that one pound of beef requires an average of 6 lbs of TDN.

Your purchase isn't a small decision. So we make a big promise with our **100% Money Back Guarantee.***

TITAN **OUTLET STORE**

Guaranteed Iron at a Guaranteed Steal.

A division of Titan Machinery – 80+ locations strong

Check - Beaver Average Dry Matter Yield 8980 lb/ac (10,058 kg/ha) over 149 site years.

- 1 Creeping rooted alfalfa types can be more tolerant to grazing than tap rooted types, and may offer better winter hardiness.
- 2 Use: (H)Hay - developed for maximum yield; may have lower persistence under grazing; (P) Pasture - varieties are low growing, higher grazing tolerance. First letter is preferred use.
- 3 Type: F-Flemish type, purple flowered & early-growing. V-Variegated type, derived from flemish & falcata type crosses. F,V-Mixed type, exhibits both characteristics.
- 4 FD: indicates the varieties characteristic to go dormant in fall. FD 9: will grow vigorously in fall; IFD 2: will have little fall growth evident. Varieties with ratings of 1 - 4 are considered adequately winter hardy for Manitoba conditions while those of 5 or higher are not well adapted. Varieties with higher ratings should be managed carefully.
- 5 WH: ability of plants to survive winter and be productive next year. Ratings utilize North American approved Winter Hardiness Zone ratings. Varieties are compared against known check varieties (1=most hardy, 5=least hardy). Score of 1 indicates adaptation to all zones, score of 2 indicates adaptability in zones 2 and above, score of 3 indicates adaptability in 3 and above. (See Winter Hardiness Zone map in front of forage section). Scores are from the Manitoba Forage Council and 3rd party northern US tests using a minimum of 4 sites years of data over 2 winters. Grazing Tolerance: University of Manitoba study (1996 - 1999) determined winterhardiness was more influential than grazing tolerance to stand persistence under grazing.

Check - Beaver Average Dry Matter Yield 8980 lb/ac (10,058 kg/ha) over 149 site years.

6 Maturity rating indicates relative comparison of first flowering dates. Early varieties will bloom before late varieties, may provide more cuts/year.
7 Disease Resistance:(HR) highly resistant; (R) resistance; (MR) moderately resistant; (S) no resistance. Bacterial Wilt (BW), Verticillium Wilt (VW) Phytophthora Root Rot (PRR).
8 Multifoliate varieties have genetic potential to produce 4 or more leaflets per leaf. This trait is influenced by environmental conditions.
9 These numbers represent the long term average yields as a percent of Beaver, on a per cut basis.
10 Brandon was discontinued in 1995 as a forage variety testing site
11 The Neepawa site was moved to Rosebank in 2004.
12 The St.Pierre site was moved to Kelburn Farms (St.Adolphe) in 2009. The average mean yields in this column contain data from the following: Kelburn Farms (2009-2011);St.Pierre (1999-2008); Steinbach (1993-1998).

MODEL 919™ MOISTURE TESTER
Shown with digital scale.
New storage/transport case for any model 919 & dig. scale.
Install tester inside the case along with any digital scale.
Protects your meter when not in use & allows for easy transport.
Also available: Test weight & canola equipment, digital scales, sample probes & thermometers.

TEST WEIGHT EQUIP.
ABS Funnel with 0.5L measure & striker.
Smart Scoop Dig.
Bu. Wt Scale.

INFRA-RED BIN PROBE
10' length total, 2 - 5' sections that couple together. Quick temperature measurement without removing the probe.
Temperature displayed digitally on small hand held unit.

SIEVES
Canola, Flax and Cereal sieve sets.
Full range of sizes, injection molded frame. Fits into existing metal sieves.

SAMPLE PROBES
4, 6, 8 and 10 ft. probes.
Lightweight anodized aluminum construction.

SMART CHARTS II
NEW Hand Held Automated Smart Charts II. NO MORE PAPER CHARTS! Choose your commodity, enter temp. & dial drum # and the % moisture is displayed.
Allows for temp. >30°C or <11°C.
NEW: 10' multi-zone rigid wireless bin probe with 4 temp. sensors. Fully wireless temp. measurement & display on Smart Charts II.

WR859 CL delivers better options and powerful disease resistance, with no compromise on yield.

With WR859 CL from Syngenta, you get higher protein, excellent yield – 11% more than AC Barrie and 3% more than Superb – and a very strong disease resistance package. You also gain flexibility in timing for seeding and harvesting as well as in your choice in herbicides. WR859 CL is available at your Richardson Pioneer Ag Business Centre.

Richardson Pioneer has wheat you need.

PIONEER® FOR THE SALE AND DISTRIBUTION OF SEED IS A REGISTERED TRADE-MARK OF PIONEER HI-BRED INTERNATIONAL, INC. AND IS USED UNDER LICENSE BY THE UNAFFILIATED COMPANY RICHARDSON PIONEER LIMITED.

The Syngenta logo is a trademark of a Syngenta Group Company. The unique Clearfield® symbol and Clearfield® are registered trademarks of BASF Agrochemical Products B.V., used with permission by BASF Canada Inc. © 2011 Syngenta Crop Protection Canada, Inc.

Seed is an investment...
... not an input cost

Is yours still holding its value?

New varieties mean increased yields, better disease resistance packages and improved characteristics for consumers. Does your seed still carry all these benefits? Make sure your investment is holding its value -- with accurate, reliable, efficient seed testing.

Association

Additional Resources

How can my farm benefit from **Seed Interactive**?

There are five or six **MCVET** sites in the southwest. How can I generate an **oat yield performance chart** using only those sites to customize data for my farm near Souris?

SEED Interactive Advantage:
Select the locations and years that best compare with your farm.

Seed Interactive allows you to select varieties suited to the agronomic and management practices on your farm. Use the **Variety Characteristics Report** to generate an overall summary using all data, or to compare disease resistance and general agronomic performance.

Use the **Yield Comparison Report** to compare two varieties at the same location. With both reports, choose your own check variety. It's easy and informative. Log on to customize selections for your farm. www.seedinteractive.ca

SEED
INTERACTIVE.CA

The logo features the word "SEED" in a large, bold, green sans-serif font. Above the letter "E" is a stylized green leaf with a yellow-orange tip. Below "SEED" is the text "INTERACTIVE.CA" in a smaller, green, all-caps sans-serif font. A horizontal dotted line is positioned below the text.

Is the grass always greener on the other side of the fence?

Use the Manitoba Management Plus Program to benchmark your farm's performance

Visit the MASC Manitoba Management Plus Program website at www.mmpp.com and you'll get unlimited access to on-farm variety and yield information provided by other Manitoba producers. This information will allow you to benchmark your own variety and yield performance against your neighbours'.

The information you'll find lists actual on-farm variety performance reported to MASC by other Manitoba producers. It's unbiased, organized, and aggregated

to keep individual data confidential. It will help you make smarter decisions and reduce your risk of losses.

One visit will provide you with the information you need to make sound decisions concerning what crops to plant, what fertilizers and pesticides you should use, seeding data and other useful agronomic information.

The Manitoba Management Plus Program – just one more way MASC is providing outstanding client service to you.

Lending and Insurance – Building a strong rural Manitoba

SEEDMB.CA
IS SPONSORED EXCLUSIVELY BY

Canada's Seed Partner
Genes that fit your farm.®

Seed information is just a click away @ www.seedmb.ca

Featuring an easier to navigate digital edition, plus...

- Additional variety information will be uploaded December/January
- Soybean seed quality data – oil and protein
- Sunflower seed quality data – oil and seed size
- Detailed edible bean results
- Final corn data
- Trial locations and plot plans updated mid July each year

Genes that fit your farm® is a registered trademark of SeCan.

**Who says you can't
win them all?**

InVigor®

We haven't just been number one this year, the past five years or even the last decade. No, InVigor® hybrids have been number one in yield for fifteen years running.*

InVigor was founded on the endless pursuit of excellence, creating superior genetics that consistently deliver outstanding early season vigor, high stress tolerance and most importantly, YIELD.

And our all-star lineup of hybrids gets even better for 2012, with the launch of five new, high yielding future hall-of-famers.

Chalk up another win for InVigor!

Bayer CropScience

The PROVING GROUND.TM

1000 Large-scale canola, soybean and corn trials across Western Canada.

More than any other seed company, Pioneer tests our genetics where it really matters: in fields close to yours. In 2011, over 1000 large-scale Proving GroundTM plots were grown across Western Canada. These canola, corn and soybean trials are grower-managed under real-world growing conditions and farming practices.

Our goal is to give you "advice well-grounded" on the right Pioneer[®] brand seed product for every acre you grow.
